Mycobacteria and the Macrophage Suzie Hingley-Wilson, Samantha Leigh Sampson, Sangeeta Tiwari, 2023-12-28 The macrophage or big eater is often considered the first cell type to encounter the causative agent of Tuberculosis TB Mycobacterium tuberculosis upon entry to the lung Once inside the macrophage the tubercle bacillus can survive and even replicate where many other invading pathogens perish Recent research suggests the bacilli adapts within this hostile environment treating the macrophage like a Trojan horse Indeed cutting edge techniques have revealed that the degree of bacterial heterogeneity and resistance to antibiotics changes within the macrophage M tuberculosis spends most of its life cycle within the macrophage and has adopted specific mechanisms to survive egress and to recruit more of this niche cell eg the Type VII secretion system ESX 1 Understanding the host pathogen interaction in tuberculous infection is key to understanding TB which remains the number one cause of death from a bacterial infection In this research topic we aim to cover advances in understanding how the tubercle bacillus adapts and survives within the host cell Determining the responsible mechanisms may reveal novel ways to target this deadly pathogen and halt its adaptation and transformation within these potentially destructive or permissive cells

Exploring Macrophage Roles in Cancer Progression and Therapeutic Targeting Yu Kato, George S. Karagiannis, David Entenberg, 2025-05-21 Macrophages are a pivotal component of the immune system known for their versatility and essential roles in development tissue repair and immune responses In the context of cancer macrophages exhibit dual roles they can contribute to antitumor immunity or conversely promote tumor progression and metastasis Tumor associated macrophages TAMs within the primary tumor microenvironment are known to facilitate tumor malignancy while metastasis associated macrophages MAMs aid in tumor cell survival and dissemination to distant organs Despite the approval of immune checkpoint inhibitors for various cancer types refractory cancers remain a significant challenge highlighting the need for novel therapeutic strategies Recent studies have underscored the importance of targeting macrophages and their associated molecules as potential anticancer and antimetastatic therapies However a comprehensive understanding of macrophage biology in cancer initiation and metastasis is still lacking necessitating further investigation into their roles and therapeutic potential This research topic aims to

elucidate the roles of macrophages in tumor initiation and metastasis with a focus on exploring their potential as therapeutic targets By investigating the complex interactions between macrophages and cancer cells this research seeks to address the unmet needs in refractory cancers and develop innovative strategies for cancer prevention and treatment Key questions include how macrophages contribute to cancer progression and how their biology can be modulated to inhibit tumor growth and metastasis

Immune system disorders: from molecular mechanisms to clinical implications Mauricio César De Marzi, Marisa Mariel Fernandez, Ruben Dario Motrich, Matias Ostrowski, 2024-10-17 In recent years the increase in knowledge about the functioning of the immune system has revealed not only its importance in the defense against external agents such as pathogens or toxins but also in the control of tumor cells and the importance of the processes of inflammation or immunological tolerance On the one hand all this knowledge has allowed a better understanding of the putative pathogenic consequences of immune system dysfunction which includes inflammatory autoimmune and immunosuppressive diseases among others On the other hand current knowledge about immunoregulation has paved the way to better prevent or control transplantation rejection However such mechanisms underlying immune dysregulation are highly variable depending on the type of pathology systemic chronic inflammatory diseases autoinflammatory diseases autoimmune disorders immunosuppression and on characteristics of the host such as sex genetics nutritional status etc Given the wide variety of pathologies that are a consequence of excessive inefficient or inadequate induction of immune responses the study of factors involved in the dysregulation of the immune system has gained great attention during the last decades

Secretion of Cytokines and Chemokines by Innate Immune Cells Paige Lacy,2015-05-19 The release of cytokines chemokines and other immune modulating mediators released from innate immune cells including eosinophils neutrophils macrophages dendritic cells mast cells and epithelial cells is an important event in immunity Cytokine synthesis and transportation occurs through the canonical protein trafficking pathway associated with endoplasmic reticulum and Golgi How cytokines are released upon their exit from the trans Golgi network varies enormously between cell types and in many cells this has not yet been characterized This issue delves into the plethora of cytokines released by innate immune cells and where possible shines light on specific mechanisms that regulate trafficking and release of Golgi derived vesicles Each cell type also shows varying degrees of dependency on microtubule organization and actin cytoskeleton remodeling for cytokine secretion Understanding the mechanisms of cytokine secretion will reveal the inner workings of individual innate immune cell types and allow identification of critical regulatory steps in cytokine release
