**Scientific and Technical Aerospace Reports** ,1994     Design Space Exploration and Resource Management of Multi/Many-Core Systems Amit Kumar Singh,Amlan Ganguly,2021-05-10 The increasing demand of processing a higher number of applications and related data on computing platforms has resulted in reliance on multi many core chips as they facilitate parallel processing However there is a desire for these platforms to be energy efficient and reliable and they need to perform secure computations for the interest of the whole community This book provides perspectives on the aforementioned aspects from leading researchers in terms of state of the art contributions and upcoming trends     Robotic Mapping and Exploration Cyrill Stachniss,2009-05-06 Robotic Mapping and Exploration is an important contribution in the area of simultaneous localization and mapping SLAM for autonomous robots which has been receiving a great deal of attention by the research community in the latest few years The contents are focused on the autonomous mapping learning problem Solutions include uncertainty driven exploration active loop closing coordination of multiple robots learning and incorporating background knowledge and dealing with dynamic environments Results are accompanied by a rich set of experiments revealing a promising outlook toward the application to a wide range of mobile robots and field settings such as

**Data Mining and Exploration** Chong Ho Alex Yu, 2022-10-27 This book introduces both conceptual and procedural aspects of cutting edge data science methods such as dynamic data visualization artificial neural networks ensemble methods and text mining There are at least two unique elements that can set the book apart from its rivals First most students in social sciences engineering and business took at least one class in introductory statistics before learning data science However usually these courses do not discuss the similarities and differences between traditional statistics and modern data science as a result learners are disoriented by this seemingly drastic paradigm shift In reaction some traditionalists reject data science altogether while some beginning data analysts employ data mining tools as a black box without a comprehensive view of the foundational differences between traditional and modern methods e g dichotomous thinking vs pattern recognition confirmation vs exploration single method vs triangulation single sample vs cross validation etc This book delineates the transition between classical methods and data science e g from p value to Log Worth from resampling to ensemble methods from content analysis to text mining etc Second this book aims to widen the learner s horizon by covering a plethora of software tools When a technician has a hammer every problem seems to be a nail By the same token many textbooks focus on a single software package only and consequently the learner tends to fit the problem with the tool but not the other way around To rectify the situation a competent analyst should be equipped with a tool set rather than a single tool For example when the analyst works with crucial data in a highly regulated industry such as pharmaceutical and banking commercial software modules e g SAS are indispensable For a mid size and small company open source packages such as Python would come in handy If the research goal is to create an executive summary quickly the logical choice is rapid model comparison If the analyst would like to explore the data by asking what if questions then dynamic graphing in JMP Pro is a better option This book uses concrete examples to explain the pros and cons of various software applications
