Research on Nonhuman Primates Charles E. Cornelius, Charles F. Simpson, 1984-01-01 Advances in Veterinary Science and Comparative Medicine Volume 28 Research on Nonhuman Primates covers topics on biomedical research in primates The book discusses the techniques of paternity exclusion analysis using technology to identify phenotypes for a large number of genetic loci as well as the importance of behavioral primatology in conserving the nonhuman primate The text also describes the establishment of the cynomolgus monkey as a laboratory animal the development of an artificial breeding colony of primates and the use of primates as animal models for various human health related problems The spontaneous and induced obesity in macaques the relationships of nonhuman primates and other animal models to human forms of diabetes and viral disease models in primates are also encompassed Veterinarians anthropologists psychologists microbiologists and those dealing with comparative medicine and primate research will find the book invaluable      Animal Tumors of the Female Reproductive Tract E. Cotchin, J. Marchant, 2012-12-06 The chapters which comprise this book were prepared as part of a medical text Pathology of the Female Genital Tract which is intended for the obstetrician gynecologist and medical pathologist In that context we were concerned to bring out the importance of the study of tumors of the female reproductive tract of animals both as showing the variety of spontaneous neoplasms that might affect the tract and as providing tumors capable of experimental reproduction These chapters are published separately since they contain information which may appeal to a range of readers who might not necessarily wish to acquire the full medical text for example to veterinary and comparative pathologists cancer research workers research workers in gynecology experimental pathologists and endocrinologists and possibly to others using animals in experimental and pharmaceutical studies The survey of spontaneous tumors of the female reproductive tract is largely concerned with tumors of the ovaries and uterus of domesticated animals but attention is also given to laboratory animals wild animals and animals in zoos The spontaneous tumors are well worth

studying not only because of their obvious clinical importance to veterinarians but also because they might provide a stimulus for epidemiologic etiologic biologic and therapeutic investigations that may elucidate some of the problems related to their counterparts in humans **Using Animals in Intramural Research**, 1999 Guide for the Care and Use of Laboratory Animals Institute of Laboratory Animal Resources (U.S.). Socha, 2012-12-06 Zoologists have categorized primates into a single order and no one doubts today that they share a common ancestry Humans and Old and New World non human primate species from the lemurs of Madagascar to the African anthropoid apes represent diverging branches of an evolutionary common trunk Along with species specific characters all primates have retained a number of ancestral traits relics of their common origin The comparative study of these species specific and ancestral traits makes it

possible to reconstruct the evolutionary pathways of humans and nonhuman primates The discovery of the human blood groups and later of the Major Histocompatibility Complex MHC had a seminal effect on the field of human genetics providing the first sound examples of Mendelian polymorphisms The use of blood group and MHC alleles as genetic markers in biological anthropology generated a conceptual revolution and persuaded researchers to begin to think in terms of populations and not only in terms of typology The counterparts of these human red and white cell antigens were found and studied in nonhuman primates and progress in this field is summarized in this book
