**Macroecology: Concepts and Consequences** British Ecological Society. Symposium, 2003-08 Macroecology Concepts and Consequences brings together for the first time major researchers in the field to present overviews of current thinking about the form and determinants of macroecological patterns Each section presents different viewpoints on the answer to a key question in macroecology such as why are most species rare why are most species small bodied and why are most species restricted in their distribution

**Algebra** Bernhard Schipp, Walter Krämer, 2008-11-27 This Festschrift is dedicated to G tz Trenkler on the occasion of his 65th birthday As can be seen from the long list of contributions G tz has had and still has an enormous range of interests and colleagues to share these interests with He is a leading expert in linear models with a particular focus on matrix algebra in its relation to statistics He has published in almost all major statistics and matrix theory journals His research activities also include other areas like nonparametrics statistics and sports combination of forecasts and magic squares just to mention a few G tz Trenkler was born in Dresden in 1943 After his school years in East G many and West Berlin he obtained a Diploma in Mathematics from Free University of Berlin 1970 where he also discovered his interest in Mathematical Statistics In 1973 he completed his Ph D with a thesis titled On a distance generating function of probability measures He then moved on to the University of Hannover to become Lecturer and to write a habilitation thesis submitted 1979 on alternatives to the Ordinary Least Squares estimator in the Linear Regression Model a topic that would become his predominant field of research in the years to come

OTS. United States. Department of Commerce. Office of Technical Services, 1977 *Integrated Models in Geography (Routledge Revivals)* Richard Chorley, Peter Haggett, 2013-11-05 First published in 1967 this book explores the theme of geographical generalization or model building It is composed of five of the chapters from the original Models in Geography published in 1967 The first chapter broadly outlines this theme and examines the nature and function of generalized statements ranging from conceptual models to scale models in a geographical context The following chapters deal with mixed system model building in geography wherein data techniques and concepts in both physical and human geography are integrated The book contains chapters on organisms and ecosystems as geographical models as well as spatial patterns in human geography This text represents a robustly anti idiographic statement of modern work in one of the major branches of geography

*Macroecology* James H. Brown, 1995-06 In Macroecology James H Brown proposes a radical new research agenda designed to broaden the scope of ecology to encompass vast geographical areas and very long time spans

While much ecological research is narrowly focused and experimental providing detailed information that cannot be used to generalize from one ecological community or time period to another macroecology draws on data from many disciplines to create a less detailed but much broader picture with greater potential for generalization Integrating data from ecology systematics evolutionary biology paleobiology and biogeography to investigate problems that could only be addressed on a much smaller scale by traditional approaches macroecology provides a richer more complete understanding of how patterns of life have moved across the earth over time Brown also demonstrates the advantages of macroecology for conservation showing how it allows scientists to look beyond endangered species and ecological communities to consider the long history and large geographic scale of human impacts An important reassessment of the direction of ecology by one of the most influential thinkers in the field this work will shape future research in ecology and other disciplines This approach may well mark a major new turn in the road in the history of ecology and I find it extremely exciting The scope of Macroecology is tremendous and the book makes use of its author s exceptionally broad experience and knowledge An excellent and important book Lawrence R Heaney Center for Environmental and Evolutionary Biology the Field Museum     **U.S.**

Rowe,1983-01-04     *Phylogenetic Ecology* Nathan G. Swenson,2019-11-20 Over the past decade ecologists have increasingly embraced phylogenetics the study of evolutionary relationships among species As a result they have come to discover the field s power to illuminate present ecological patterns and processes Ecologists are now investigating whether phylogenetic diversity is a better measure of ecosystem health than more traditional metrics like species diversity whether it can predict the future structure and function of communities and ecosystems and whether conservationists might prioritize it when formulating conservation plans In *Phylogenetic Ecology* Nathan G Swenson synthesizes this nascent field s major conceptual methodological and empirical developments to provide students and practicing ecologists with a foundational overview Along the way he highlights those realms of phylogenetic ecology that will likely increase in relevance such as the burgeoning subfield of phylogenomics and shows how ecologists might lean on these new perspectives to inform their research programs

one volume are forty classic papers that have laid the foundations of modern ecology Whether by posing new problems demonstrating important effects or stimulating new research these papers have made substantial contributions to an understanding of ecological processes and they continue to influence the field today The papers span nearly nine decades of ecological research from 1887 on and are organized in six sections foundational papers theoretical advances synthetic statements methodological developments field studies and ecological experiments Selections range from Connell s elegant

account of experiments with barnacles to Watt's encyclopedic natural history from a visionary exposition by Grinnell of the concept of niche to a seminal essay by Hutchinson on diversity Six original essays by contemporary ecologists and a historian of ecology place the selections in context and discuss their continued relevance to current research This combination of classic papers and fresh commentaries makes *Foundations of Ecology* both a convenient reference to papers often cited today and an essential guide to the intellectual and conceptual roots of the field Published with the Ecological Society of America

**Vegetation Ecology** Eddy van der Maarel, 2009-04-01 *Vegetation Ecology* is a comprehensive account of plant communities and their environments Written by leading experts in their field from four continents this up to date innovative text covers the composition structure ecology diversity distribution and dynamics of plant communities with an emphasis on functional adaptations to the abiotic and biotic processes governing plant communities reviews the modern developments in vegetation ecology in a historical perspective presents a coherent view on vegetation ecology while integrating population ecology dispersal biology biotic interactions herbivory interactions with soil organisms and ecosystem ecology and tackles applied aspects of vegetation ecology notably nature management restoration ecology and global change studies Aimed at advanced undergraduates graduates and researchers in plant ecology geography forestry and nature conservation *Vegetation Ecology* takes an integrated multi disciplinary approach and will be welcomed as an essential reference for plant ecologists the world over

**Reconstructing the Tree of Life** Trevor R. Hodkinson, John A.N. Parnell, 2006-12-26 To document the world's diversity of species and reconstruct the tree of life we need to undertake some simple but mountainous tasks Most importantly we need to tackle species rich groups We need to collect name and classify them and then position them on the tree of life We need to do this systematically across all groups of organisms and b

**Classification of Plant Communities** R.H. Whittaker, 2012-12-06 The natural communities of the world are diverse and many schools of ecology have developed classifications of communities in partial independence of one another There is consequently a vast and widely dispersed literature on the classification of plant and animal communities comprising divergent approaches of different schools and representing a great experiment on the usefulness of different possibilities for classification The editor sought in a review monograph of 1962 to summarize these schools and their history and in 1973 published a treatise on Ordination and Classification of Communities as volume 5 of the *Handbook of Vegetation Science* We were fortunate in preparing the latter work to have a truly international panel of authors to discuss different major approaches to classification This second edition of the book of 1973 is intended to make the work more widely available in a less expensive form as companion volumes on ordination and on classification of plant communities

**A Critique for Ecology** Robert Henry Peters, 1991-07-26 This is a book of criticism It is directed at contemporary ecology but would apply to any science or indeed any statement that claims to contain information Application of simple criteria to judge the information in ecological statements reveals deep inadequacies in the science Furthermore the complexity of the contemporary field of

ecology and the mistraining of a generation of ecologists has obscured its weakness As a result many ecologists are unaware of the failings of the science although others are deeply concerned for the future of the field The author Professor Peters argues that a return to simple question of fact to observations and to questions of general relevance to science and society can make ecology a useful practical and informative science Such science is desperately needed to meet the problems of the age A thought provoking book that will be of interest to all scientists but in particular ecologists from undergraduates to senior academics and professionals

**The Species-Area Relationship** Thomas J. Matthews, Kostas A. Triantis, Robert J. Whittaker, 2021-03-18 The species area relationship SAR describes a range of related phenomena that are fundamental to the study of biogeography macroecology and community ecology While the subject of ongoing debate for a century surprisingly no previous book has focused specifically on the SAR This volume addresses this shortfall by providing a synthesis of the development of SAR typologies and theory as well as empirical research and application to biodiversity conservation problems It also includes a compilation of recent advances in SAR research comprising novel SAR related theories and findings from the leading authors in the field The chapters feature specific knowledge relating to terrestrial marine and freshwater realms ensuring a comprehensive volume relevant to a wide range of fields with a mix of review and novel material and with clear recommendations for further research and application
