returns are not equally distributed over time sources for statistical arbitrage occur The semi variance model takes skewness into account and provides higher returns at lower volatility than the Garch model The concept is aimed to be a synopsis of mean reversion and chart pattern detection The computer model is generated with respect to Brownian motion and technical analysis and provides significant returns to the investment While the market efficiency hypothesis states the impossibility of long term arbitrage opportunities market anomalies outstand significantly Connecting both elements creates a profitable trading system The combination of both approaches delivers a sensible hedge fund concept The out of sample backtest verifies out performance and implies the need for further research in the area of higher moment CAPM and additional market timing strategies as sources of statistical arbitrage
