

- All living things are made of cells
- These cells can be either prokaryotic or eukaryotic
- Eukaryotic cells are complex and include animal and plant cells
- Prokaryotic cells are smaller and simpler

Both plant and animal cells contain

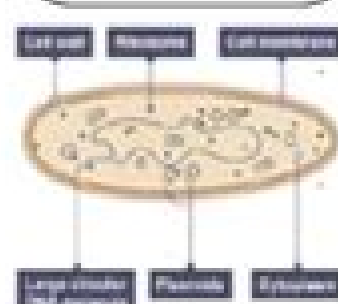

Start:
G1 - When cell division starts, the cell gets bigger
S - more DNA is made in preparation for mitosis
G2 - Preparation for mitosis for M - Mitosis

Mitosis:
The cell prepares to chromosomes duplicate - G2 chromosomes
The cell gets pulled apart
You have two duplicate cells

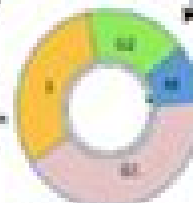

Cell differentiation:
Animals: Most cells die during embryonic development, in later life this is repair and replacement
Plants: Can continue to differentiate throughout a plant's life

Key words:
Eukaryotes - are organisms that are made up of eukaryotic cell
Prokaryotes - are prokaryotic cells
Differentiation - is the process by which a cell changes to become specialised for its job

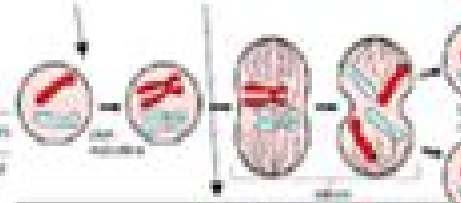

Bacteria cells:
They are simple so they can divide easily and quickly
They don't have a nucleus they have large circular and plasmid DNA

Ribosomes: site of protein synthesis
Mitochondria: site of respiration Provides energy for the cell
Xylem cells: Carry water from roots all the way up the plant
Phloem cells: Carry food from leaves down the plant

Cell Biology

G1 - Growth
1. This system
G2 - Growth and preparation for mitosis
M - Mitosis (cell division)

Stem cells:
This is an undifferentiated cell of an organism that is capable of differentiating into any type of specialised cell

Chromosomes:
Each cell has 23 chromosomes
They are in the cell's nucleus
Different genes control different characteristics

Treatment:
Stem cells may help to treat diabetes, making insulin-producing cells, and paralysis, making nerve cells
Therapeutic cloning:
Embryos can be made to have the same genes as the patient
This means no rejection

Sperm cell:
Fertilises an egg cell
It has a flagellum and streamline head to help it swim
It has a lot of mitochondria for energy
It has enzymes in head to cut the egg membrane

Phloem cell:
Carries fluids around the plant they have very few subcellular structures so stuff can flow through them

Root hair cell:
Absorbs water and minerals
They have long 'hairs' which gives them a larger surface area

Muscle cell:
Contracts quickly
They are long so they have space to contract
They have a lot of mitochondria to generate lots of energy

Nerve cell:
Carries electrical impulses around the body
Long and have branched connections at each end meaning they can form a network around the body

Adult bone marrow cells:
Can form many types of human cells
Adult bone marrow cells can form many cells including blood

Objectives:
An embryo is a potential human life, should it be tested on?
Some believe that curing suffering is more important than the rights of an embryo
People feel scientists should concentrate on developing ways that don't include embryos
In some countries the use of embryos is banned

Diffusion:
Diffusion is affected by:
Diffusion distance
Concentration
Surface area
Movement of particles from a **HIGHER** concentration to a **LOWER** concentration through a semi-permeable membrane
It happens naturally to achieve balance
Movement of water particles from a **HIGHER** concentration to a **LOWER** concentration through a semi-permeable membrane

Active transport:
Movement **AGAINST** a concentration gradient
Requires energy
Transport in cells
Osmosis

Active transport:
Root hair cell
Absorbs minerals against the concentration gradient when necessary
Gut
Absorbs nutrients into the blood against the concentration gradient when necessary

Target - swollen cell
Flaccid - shrivelled cell

Diffusion:
Lungs, Alveoli
The lungs have a massive surface area
2 cell thick diffusion distance
The blood flow means the concentration of oxygen in the blood is always lower than in the lungs
Small intestines, Villi
The surface area is massive, also has more villi on the villi making it even bigger
2 cell thick diffusion distance
The blood flow means there is always a lower concentration of sugars in the blood than the intestine
Leaf
Short diffusion distance, there are little holes on the bottom of the leaf that CO2
Gills
Oxygen diffuses from the water in to the blood on the gills
Big surface area, gill filaments
Thin diffusion distance
The blood flow means there is always a lower concentration of oxygen in the blood than the water
