What Is Hypertension?
Hypertension is a chronic condition in which the blood pressure is consistently high. It is a leading cause of heart disease and stroke. The most common type of hypertension is called essential hypertension, which has no known cause. Other types of hypertension are called secondary hypertension, which is caused by a specific condition or disease.

Cerebral Hypertension

Cerebral hypertension is a condition in which the blood pressure in the brain is high. It can lead to a stroke, which is a sudden loss of brain function. The most common cause of cerebral hypertension is atherosclerosis, a condition in which the arteries become narrowed and hardened. Other causes include a blood clot in the brain, a brain tumor, or a brain aneurysm.

Obstructive Hypertension

Obstructive hypertension is a condition in which the blood pressure is high due to a blockage in the arteries. This can be caused by atherosclerosis, a blood clot, or a tumor. The blockage prevents blood from flowing freely, which causes the blood pressure to rise.

Measurement
Blood pressure is measured using a sphygmomanometer. The device consists of an inflatable cuff that is wrapped around the upper arm. The cuff is inflated to a pressure higher than the systolic blood pressure, which temporarily stops the flow of blood. The cuff is then slowly deflated, and the pressure at which the blood flow resumes is recorded as the systolic blood pressure. The pressure at which the blood flow returns to normal is recorded as the diastolic blood pressure.

Vascular Hypertension

Vascular hypertension is a condition in which the blood pressure is high due to a narrowing of the blood vessels. This can be caused by atherosclerosis, a condition in which the arteries become narrowed and hardened. Other causes include a blood clot, a brain tumor, or a brain aneurysm.

Coronary Hypertension

Coronary hypertension is a condition in which the blood pressure is high in the coronary arteries, which supply the heart with blood. This can lead to a heart attack, which is a sudden loss of heart function. The most common cause of coronary hypertension is atherosclerosis, a condition in which the arteries become narrowed and hardened. Other causes include a blood clot, a brain tumor, or a brain aneurysm.

Significance

Hypertension is a serious condition that can lead to heart disease, stroke, and kidney failure. It is important to have your blood pressure checked regularly and to take medication if you are prescribed it. Lifestyle changes, such as eating a healthy diet and exercising, can also help to lower blood pressure.

High Blood Pressure Therapy

Renal Hypertension

Renal hypertension is a condition in which the blood pressure is high due to a problem with the kidneys. This can be caused by a kidney stone, a kidney infection, or a kidney tumor. The kidneys are responsible for filtering waste from the blood, and a problem with the kidneys can cause the blood pressure to rise.
