

JURASSIC PARK RAPTOR VS REAL RAPTORS

(based on the current scientific understanding)

CLEVER GIRL?

The movie portrays raptors as ultra intelligent killing machines.

Although intelligence in dinosaurs and raptors is often underappreciated, there is no evidence for *Deinonychus* and its possessing it to such high levels.

SIZE

In the movie raptors are tall enough to stare down Ned in the eye.

Deinonychus would have stood as tall as a short child and *Velociraptor* were a half your knee height.

Since Jurassic Park was released, raptors of a similar size to the ones in it, the *Mutaborator* and *Archibator* have been described.

NAMING

The Jurassic Park raptors were based on the North American *Deinonychus*.

In the movie they are called *Velociraptors*, partly because of naming issues at the time, but mostly because it just sounds cooler.

HANDS

Movie raptors have downward facing hands.

The actual dinosaurs were not able to rotate their hands that way. Their hands faced each other in a "clapping" position.

FEET

The raptors in Jurassic Park walk on big padded feet.

Deinonychus and its relatives had more slender, bird-like feet.

FEATHERS

The movie features large white winged monsters. *Velociraptor*, *Deinonychus* and its were covered in feathers from head to tail.

TAILS

The movie raptors have deadly tails which they wriggle around. The real animals used their tails as a stiff counterbalance, holding it straight with vertical feathers.

Bird, Daniel E. Varland, Juan Jose Negro, 1996-02-08 This book is a collection of papers highlighting ways in which Raptors have successfully adapted to man made landscapes and structures The coverage of Raptors in Human Landscapes is broad ranging from the impact of human activity on country wide scales to the particular conditions associated with urban cultivated and industrial landscapes as well as to the various schemes specifically directed towards the provision of artificial nest sites and platforms The cases described hail from a wide geographic range including North and South America Europe Africa and elsewhere and from a broad spectrum of species groups such as the falcons accipiters eagles kites and many others This is a book of immense value not only to ornithologists and conservation biologists but also to engineers and managers involved in all kinds of building and environmental work in

Raptors Keith L. Bildstein,2017-05-02 Raptors are formally classified into five families and include birds such as eagles ospreys kites true hawks buzzards harriers vultures and falcons that are familiar and recognized by many observers These

diurnal birds of prey are found on every continent except Antarctica and can thrive in seemingly inhospitable spots such as deserts and the tundra. They have powerful talons and hooked beaks for cutting and tearing meat and keen binocular vision to aid in their hunting prowess. Because of their large size, distinctive feeding habits and long distance flight patterns, raptors intrigue humans and have been the subject of much general interest as well as extensive scientific research. Keith L. Bildstein has watched and studied raptors on five continents and is well prepared to explain their critical importance not only as ecological entities but also as inspirational tokens across natural and human dominated landscapes. His book offers a comprehensive and accessible account of raptors including their evolutionary history, their relationships to other groups of birds, their sensory abilities, their general natural history, their breeding ecology and feeding behavior and threats to their survival in a human dominated world. Biologically sound but readable, *Raptors* is a nontechnical overview of this captivating group. It will allow naturalists, birders, hawk watchers, science educators, schoolchildren and the general public along with new students in the field of raptor biology to understand and appreciate these birds and in so doing better protect them.

The Golden Eagle Jeff Watson, 2010-08-23. This comprehensive monograph is a second edition of one of the most popular Poyser monographs; it covers all aspects of this spectacular eagle's biology and ecology including a full review of the literature and incorporating the considerable body of research on the species since the publication of the first edition in 1997. The late Jeff Watson was one of Scotland's foremost eagle experts with more than 20 years of research on the birds. Following Jeff's untimely death, the book is being completed by his colleagues Des Thompson and Helen Riley. Scottish studies provide the foundation for a treatment that also includes up to date information from work in North America, continental Europe and elsewhere. This global view allows fascinating insights into the species' relationships with a variety of different habitats and leads to many new and important conclusions regarding its ecology. This highly readable and authoritative account is destined to become the standard reference on the species both in Scotland and elsewhere in the world. The text is enriched with many superb pictures of this majestic bird and additional wash landscapes capture the very special atmosphere of Scotland's Golden Eagle country.
