Source Separation and Machine Learning Jen-Tzung

Chien, 2018-10-16 Source Separation and Machine Learning presents the fundamentals in adaptive learning algorithms for Blind Source Separation BSS and emphasizes the importance of machine learning perspectives. It illustrates how BSS problems are tackled through adaptive learning algorithms and model based approaches using the latest information on mixture signals to build a BSS model that is seen as a statistical model for a whole system. Looking at different models including independent component analysis ICA nonnegative matrix factorization NMF nonnegative tensor factorization NTF and deep neural network DNN the book addresses how they have evolved to deal with multichannel and single channel source separation. Emphasizes the modern model based Blind Source Separation BSS which closely connects the latest research topics of BSS and Machine Learning. Includes coverage of Bayesian learning sparse learning online learning discriminative learning and deep learning. Presents a number of case studies of model based BSS categorizing them into four modern models ICA NMF NTF and DNN using a variety of learning algorithms that provide solutions for the construction of BSS systems.

Auralization Michael Vorländer, 2007-10-27 Auralization is the creation of audible acoustic sceneries from computer generated data. The term auralization is to be understood as being analogue to the well known technique of visualization. In visual illustration of scenes data or any other meaningful information in movie animation and in computer graphics we describe the process of making visible as visualization. In acoustics auralization is taking place when acoustic effects primary sound signals or means of sound reinforcement or sound transmission are processed to be presented by using electro acoustic equipment. This book is organized as comprehensive collection of basics methodology and strategies of acoustic simulation and auralization. With mathematical background of advanced students the reader will be able to follow the main strategy of auralization easily and work own implementations of auralization in various fields of applications in acoustic engineering sound design and virtual reality. For readers interested in basic research the technique of auralization may be useful to create sound stimuli for specific investigations in linguistic medical neurological and psychological research and in the field of human machine interaction.

Sound Capture for Human / Machine Interfaces Wolfgang

Herbordt, 2005-03-22 With a continuously increasing desire for natural and comfortable human machine interaction the acoustic interface of any terminal for multimedia or telecommunication services is challenged to allow seamless and hands free audio communication. Sound Capture for Human Machine Interfaces introduces the practical aspects of microphone array signal processing and presents various combinations of beamforming and acoustic echo cancellation.

Richard

Foreman Neal Swettenham, 2017-11-10 Richard Foreman has been writing directing and designing avant garde theatre in New York since he first founded his Ontological Hysteric company there in 1968. In all that time few directors have taken up the challenge of staging his problematic rewarding texts and Foreman's work remains under explored by other practitioners.

Richard Foreman *An American Partly in Paris* argues that Foreman can productively be viewed as a partly European artist whose thinking and theatre making have been radically shaped by contact with Europe Through a detailed account of his European productions interviews with Foreman himself a set of practical strategies for staging the plays and the full text of Foreman s previously unpublished play *Georges Bataille s Bathrobe* 1983 Neal Swettenham introduces the director s work to a new generation of readers and theatre makers *Noise Control in Industry, Third Edition* Sound Research

Ocean Observation based on Underwater Acoustic Technology, volume II Xuebo Zhang, Haixin Sun, Arata Kaneko, Suleman Mazhar, 2024-12-02

Since the sound wave is the only information carrier that can propagate long distances in the ocean underwater acoustic technology based on sound waves undoubtedly plays an important role in ocean observation. The development of underwater acoustic technology requires the support of various underwater acoustic sensors and signal processing techniques. The function of an underwater acoustic sensor is to conduct the conversion between an underwater acoustic signal and an electric signal. Their performance directly determines the quality of underwater acoustic equipment. However, the harsh environment such as high pressure, high temperature, and highly corrosive fluids, as well as different requirements such as low frequency, broad bandwidth, high power, and deep water, often affect the physical properties of materials and structural performance of transducers, which deteriorates the transducer performance. Due to the lack of comprehensive research on key techniques including material physical properties and interfacial bond properties, the reliability of structural components is often seriously affected by environmental conditions, which may lead to major performance degradation or even failure with the device performance. Therefore, it is challenging for the transducer design to balance the acoustic performance and the device's stability.
