*Introduction by the column editors:* A solid body of evidence indicates that therapy programs that combine neuroleptic medication with behavioral intervention are more effective in reducing relapse and improving psychosocial functioning than those that use medication alone to treat schizophrenia (1,2). Although researchers have moved away from a biologically simplistic to a multifactorial approach to treating schizophrenia, current practice guidelines are rarely implemented at the clinical level. One limiting factor in the dispersion of combined medication and psychosocial programs has been the lack of replicable and manualized psychosocial treatments that can be readily implemented by line-level clinicians.

One example of a manualized cognitive-behavioral treatment program for schizophrenia is integrated psychological therapy (IPT) (3). Operating on the assumption that patients with schizophrenia have cognitive dysfunctions—for

example, in social perception—as well as deficits in social and problem-solving skills, IPT offers remediation of all of these deficits in group or individual settings. In this report on the impact of IPT in Spain, its combined value with behavioral family therapy is highlighted in a country other than where the intervention was initially designed and tested.

**I**PT comprises subprograms for mediating deficits in five areas: cognitive differentiation, social perception, verbal communication, social competence, and interpersonal problem solving. The first two concentrate on the basic cognitive functions; the others proceed to the more complex tasks of helping participants acquire social and problem-solving skills once they have succeeded in improving their basic cognitive functions.

Each subprogram uses gradual increases in learning demands over the course of therapy. In addition, the program's initial structure and task orientation gradually give way to greater emphasis on spontaneous group interaction. With the aim of developing the participants' ability to deal adequately with emotions and affects, the initial exercises in each subprogram contain neutral material that is assumed not to be stressful. As therapy progresses, emotionally loaded material is gradually introduced.

IPT has been used for persons with schizophrenia in many countries, including Switzerland, Germany, Aus-

tria, Chile, Japan, the United States, and others. In this article, we present our experience with group training with four of the five subprograms—cognitive differentiation was not included—combined with a family psychoeducation approach targeting both patients and family members, in the Spanish province of Cantabria.

## Description

Subprograms of the integrated therapy package were implemented in separate groups of four to seven persons with schizophrenia or of their families for 12 months; follow-up assessments were made nine months later. The intervention program and the follow-up sessions took place in 1997 and 1998. The groups were held in the psychiatric outpatient department of a general hospital sponsored by the National Health System.

Patients' relatives attended, on average, 31 sessions in the first year, in four stages. For the first ten weeks, relatives attended weekly, hour-long psychoeducation sessions. (A list of the topics of these sessions and examples of concerns expressed by family members is available from the authors.) The sessions were organized to facilitate interactions between trainers and family members and among family members. This approach allowed a variety of experiences and viewpoints to be presented, which promoted group discussion. Family members also were provided a written guide, available in Spanish from the authors, that included basic information about schizophrenia.

*All of the authors are at the Sierrallana Hospital in Torrelavega (Cantabria), Spain, except Dr. Rodier, who is with the department of psychiatry at the University of Bern, Switzerland. **The Pathological Family** Deborah Weinstein, 2013-02-19

While iconic popular images celebrated family life during the 1950s and 1960s American families were simultaneously regarded as potentially menacing sources of social disruption The history of family therapy makes the complicated power of the family at midcentury vividly apparent Clinicians developed a new approach to psychotherapy that claimed to locate the cause and treatment of mental illness in observable patterns of family interaction and communication rather than in individual psyches Drawing on cybernetics systems theory and the social and behavioral sciences they ambitiously aimed to cure schizophrenia and stop juvenile delinquency With particular sensitivity to the importance of scientific observation and visual technologies such as one way mirrors and training films in shaping the young field The Pathological Family examines how family therapy developed against the intellectual and cultural landscape of postwar America As Deborah Weinstein shows the midcentury expansion of America's therapeutic culture and the postwar fixation on family life profoundly affected one another Family therapists and other postwar commentators alike framed the promotion of democracy in the language of personality formation and psychological health forged in the crucible of the family As therapists in this era shifted their clinical gaze to whole families they nevertheless grappled in particular with the role played by mothers in the onset of their children's aberrant behavior Although attitudes toward family therapy have shifted during intervening generations the relations between family and therapeutic culture remain salient today *Schizophrenia Bulletin*, 1998 **The British**
