Abstract

A 2.5 TPD post-combustion CO₂ capture plant for brown coal and a 0.5 TPD pre-combustion CO₂ capture IGCC process have been designed and are being built in Victoria, Australia to assess developments in solvent absorption capture technologies. In this paper, the flowsheets developed for these processes will be discussed along with the underpinning research in the following areas:

- New contact equipment – recent work has shown that the SMR packing has enhanced performance over structured packing and standard Pall rings.
- The influence of promoters to enhance kinetics – using a wetted-wall column, experiments have been conducted with boric acid added to potassium carbonate solvent with results showing an enhancement in CO₂ absorption rates.
- The influence of flue gas impurities – post-combustion impurities, including SO_x and NO_x, have been studied with potassium carbonate to evaluate their effects on CO₂ absorption.
- Process modeling – Aspen Plus[®] simulations have been developed to predict column performance and the effects of impurities on the equilibrium relationship.

New Developments in Dietary Fiber Ivan Furda, Charles J. Brine, 2013-04-09 It has been acknowledged that the physiological effects of dietary fiber are an exceedingly complex matter which requires a multidisciplinary research effort The increased scientific involvement of the medical community nutritionists chemists and physicists is not only warranted but it has become mandatory This is because we are entering a more advanced research phase in which the observed in vivo effects should not be only recorded but they should be systematically correlated with the physicochemical and analytical properties of the individual dietary fibers The Division of Agricultural and Food Chemistry of the American Chemical Society has recognized this for some time and has asked us to organize another International Symposium similar to one in 1982 which would address the latest developments in this field We decided to ask a cross section of leading experts from industrial and academic research institutions to assess the state of the art in dietary fiber namely in the areas of the physiological effects physicochemical attributes and in existing and proposed analytical methods We also felt that chemistry and physical chemistry should play a greater role in fiber research to complement and better explain the existing in vivo data There is a large volume of animal and human physiological and nutritional data available Unfortunately the generated information is frequently confusing One reason is that this research is not conducted with well characterized compounds but rather with loosely defined complex mixtures or entities
