Wave Propagation in Structures James F. Doyle, 2012-12-06 *Mechanical engineering an engineering discipline* borne of the needs of the industrial revolution is once again asked to do its substantial share in the call for industrial renewal The general call is urgent as we face profound issues of productivity and competitiveness that require engineering solutions among others The *Mechanical Engineering Series* features graduate texts and research monographs intended to address the need for information in contemporary areas of mechanical engineering

The series is conceived as a comprehensive one that covers a broad range of concentrations important to mechanical engineering graduate education and research. We are fortunate to have a distinguished roster of consulting editors on the advisory board, each an expert in one of the areas of concentration. The names of the consulting editors are listed on the facing page of this volume. The areas of concentration are applied mechanics, biomechanics, computational mechanics, dynamic systems, and control, energetics, mechanics of materials, processing, thermal science, and tribology.

Supporting Teacher Development Debra Eckerman Pitton, 2016-04-14 This text provides opportunities for administrators to use evaluation processes more effectively to support teacher development. Through the use of practice scenarios and communication exercises, principals can develop a more supportive relational process for teacher evaluation. Too often, principals provide evaluation feedback in ways that do not resonate with teachers. This text examines the communicative process and provides practice and skill building opportunities that will enable principals to develop supportive environments that help teachers continue to grow.

Tau-p: a plane wave approach to the analysis of seismic data P.L. Stoffa, 2012-12-06 In exploration seismology, data are acquired at multiple source and receiver positions along a profile line. These data are subsequently processed and interpreted. The primary result of this process is a subsurface image of the exploration target. As part of this procedure, additional information is also obtained about the subsurface material properties, e.g., seismic velocities. The methods that are employed in the acquisition and processing of exploration seismic data are internally consistent. That is, principally near vertical incidence seismic waves are generated, recorded, and subsequently imaged. The data processing methods commonly used are based upon a small angle of incidence approximation, thus making the imaging problem tractable for existing data processing technology. Although tremendously successful, the limitations of this method are generally recognized. Current and future exploration goals will likely require the use of additional seismic waves, i.e., both compressional and shear, precritical and postcritical reflections and refractions. Also, in addition to making better use of seismic travel times, recent efforts to directly incorporate seismic amplitude variations show that the approach may lead to a better understanding of subsurface rock properties. In response to more demanding exploration goals, recent data acquisition techniques have improved significantly by increasing the spatial aperture and incorporating a large number of closely spaced receivers. The need for better subsurface resolution in depth and position has encouraged the use of 240, 512, and even 1024 recorded data channels with receiver separations of 5 to 25 m.
