

Residue Number System Arithmetic

For *addition* we can write

$$\gamma_i = A + B - \left[\frac{A+B}{p_i} \right] p_i$$

for $i = 1, 2, \dots, n$.

Representation of A and B are

$$A = k_i p_i + \alpha_i,$$

$$B = l_i p_i + \beta_i,$$

$$i = 1, 2, \dots, n,$$

where k_i and l_i are non negative integers.

Then

$$A + B = (k_i + l_i) p_i + \alpha_i + \beta_i,$$

$$\left[\frac{A+B}{p_i} \right] = k_i + l_i + \left[\frac{\alpha_i + \beta_i}{p_i} \right],$$

$$i = 1, 2, \dots, n$$

From which

$$\gamma_i = \alpha_i + \beta_i - \left[\frac{\alpha_i + \beta_i}{p_i} \right] p_i,$$

Finite Precision Number Systems and Arithmetic Peter Kornerup, David W. Matula, 2010-09-30 Fundamental arithmetic operations support virtually all of the engineering scientific and financial computations required for practical applications from cryptography to financial planning to rocket science This comprehensive reference provides researchers with the thorough understanding of number representations that is a necessary foundation for designing efficient arithmetic algorithms Using the elementary foundations of radix number systems as a basis for arithmetic the authors develop and compare alternative algorithms for the fundamental operations of addition multiplication division and square root with precisely defined roundings Various finite precision number systems are investigated with the focus on comparative analysis of practically efficient algorithms for closed arithmetic operations over these systems Each chapter begins with an introduction to its contents and ends with bibliographic notes and an extensive bibliography The book may also be used for graduate teaching problems and exercises are scattered throughout the text and a solutions manual is available for instructors

Residue Number Systems P.V. Ananda Mohan,2012-12-06 There has been continuing interest in the improvement of the speed of Digital Signal processing The use of Residue Number Systems for the design of DSP systems has been extensively researched in literature Szabo and Tanaka have popularized this approach through their book published in 1967 Subsequently Jenkins and Leon have rekindled the interest of researchers in this area in 1978 from which time there have been several efforts to use RNS in practical system implementation An IEEE Press book has been published in 1986 which was a collection of Papers It is very interesting to note that in the recent past since 1988 the research activity has received a new thrust with emphasis on VLSI design using non ROM based designs as well as ROM based designs as evidenced by the increased publications in this area The main advantage in using RNS is that several small word length Processors are used to perform operations such as addition multiplication and accumulation subtraction thus needing less instruction execution time than that needed in conventional 16 bit/32 bit DSPs However the disadvantages of RNS have been the difficulty of detection of overflow sign detection comparison of two numbers scaling and division by arbitrary number RNS to Binary conversion and Binary to RNS conversion These operations unfortunately are computationally intensive and are time consuming
