

# Parallel vs. concurrent

---

- **parallel:** Using multiple processing resources (CPUs, cores) at once to solve a problem faster.
  - Example: A sorting algorithm that has several threads each sort part of the array.
- **concurrent:** Multiple execution flows (e.g. threads) accessing a shared resource at the same time.
  - Example: Many threads trying to make changes to the same data structure (a global list, map, etc.).
- Many programmers confuse these two concepts.
  - Threads are often used to implement both.

*Resources in Parallel and Concurrent Systems*, 1991 Computer Systems Organization Parallel architecture [NASA Information Sciences and Human Factors Program Annual Report, 1987](#) United States. National Aeronautics and Space Administration. Information Sciences and Human Factors Division, 1988 **Concurrency & Parallelism** Reeshabh Choudhary, 2024-05-15 Concurrency Parallelism is about developing an intuition about what happens underneath a program so that developers can first focus on utilizing the available resources at hand before thinking of scaling the solution This is the very art of engineering making use of resources in limited budget and getting things done Once a developer understands what is going on beneath the surface the programming languages are nothing but just abstractions via which we talk to our computers And this is one of the reasons why this book has used minimal programming language Rather than focusing on programming language once a software developer starts to think with respect to the device at hand then the real journey of programming starts This book just barely tries to scratch the surface of the vast world of programming and starts from the very basic concepts of Operating Systems and then moving on to application development and in the second part interaction with the databases is covered The book tries to capture the evolution of programming from concurrent execution of sequential programs to parallel programs alongside the evolution of computer architecture Book is written in a very language agnostic way as the author believes programming languages are nothing but just an abstraction over computer resources

*Communicating Process Architectures 2004* Ian East,J. Martin,P.H. Welch,2004 Communicating Process Architecture CPA describes an approach to system development that is process oriented It makes no great distinction between hardware and software It has a major root in the theory of Communicating Sequential Processes CSP However the underlying theory is not limited to CSP The importance of mobility of both channel and process within a network sees integration with ideas from the calculus Other formalisms are also exploited such as BSP and MPI The focus is on sound methods for the engineering of significant concurrent systems including those that are distributed across the Internet or within a single chip and or software scheduled on a single execution unit Traditionally at CPA the emphasis has been on theory and practice developing and applying tools based upon CSP and related theories to build high integrity systems of significant size In particular interest focuses on achieving scalability and security against error The development of Java C and C libraries to facilitate secure concurrent programming using mainstream languages has allowed CPA to continue and proliferate This work continues in support of the engineering of distributed applications Recently there has been greater reference to theory and its more direct application to programming systems and languages In this volume the formal CSP is very well presented The papers provide a healthy mixture of the

academic and commercial software and hardware application and infrastructure which reflects the nature of the discipline
