Dynamical Models In Neurocognitive Psychology Ralf Engbert, 2021-03-02 The development of cognitive models is a key step in the challenging research program to advance our understanding of human cognition and behavior Dynamical models represent a general and flexible approach to cognitive modeling This introduction focuses on applications of stochastic processes and dynamical systems to model cognition The dynamical approach is particularly useful to emphasize the strong link between experimental research and its paradigms data analysis and mathematical models including their computer implementation for numerical simulation Most of specific examples are from the domain of eye movement research with concepts being applicable to a broad range of problems in cognitive modeling The textbook aims at the graduate and or advanced undergraduate level for students in Cognitive Science and related disciplines such as Psychology and Computer Science Joint introduction of the theory of cognitive processes and mathematical models their underlying mathematical concepts numerical simulation and analysis The focus on eye movements provide a theoretically coherent but very general application area Computer code in R Programming Language for Statistical Computing is available for all examples figures and solutions to exercises

Stevens' Handbook of Experimental Psychology, Methodology in Experimental Psychology John T. Wixted, 2004-01-16 Now available in paperback This revised and updated edition of the definitive resource for experimental psychology offers comprehensive coverage of the latest findings in the field as well as the explosion of research in neuroscience Volume Four Methodology in Experimental Psychology organized by topic focuses on the comparative research methods used to measure psychological social behavioral and cognitive processes in human development

Mathematical Models of Perception and Cognition Volume I Joseph W. Houpt, Leslie M. Blaha, 2016-05-20 In this two volume festschrift contributors explore the theoretical developments Volume I

and applications Volume II in traditional cognitive psychology domains and model other areas of human performance that benefit from rigorous mathematical approaches It brings together former classmates students and colleagues of Dr James T Townsend a pioneering researcher in the field since the early 1960s to provide a current overview of mathematical modeling in psychology Townsend s research critically emphasized a need for rigor in the practice of cognitive modeling and for providing mathematical definition and structure to ill defined psychological topics The research captured demonstrates how the interplay of theory and application bridged by rigorous mathematics can move cognitive modeling forward

Physics of the Human Temporality Ihor Lubashevsky, Natalie Plavinska, 2021-10-21 This book presents a novel account of the human temporal dimension called the human temporality and develops a special mathematical formalism for describing such an object as the human mind One of the characteristic features of the human mind is its temporal extent For objects of physical reality only the present exists which may be conceived as a point like moment in time In the human temporality the past retained in the memory the imaginary future and the present coexist and are closely intertwined and impact one another This book focuses on one of the fragments of the human temporality called the complex present A detailed analysis of the classical and modern concepts has enabled the authors to put forward the idea of the multi component structure of the present For the concept of the complex present the authors proposed a novel account that involves a qualitative description and a special mathematical formalism This formalism takes into account human goal oriented behavior and uncertainty in human perception The present book can be interesting for theoreticians physicists dealing with modeling systems where the human factor plays a crucial role philosophers who are interested in applying philosophical concepts to constructing mathematical models and psychologists whose research is related to modeling mental processes

Why Context Matters Thomas Friemel, 2008-11-06 In the last few years there has been a growing interest in using computers not only for quantitative but also for qualitative content analyses of various kinds of texts and unstructured interviews Fielding and Lee 1993 Kelle 1998 Kuckartz 2001 Miles and Huberman 2005 Lewins and Silver 2007 This trend has given rise to the development of new software products such as MAXqda NVivo NUD IST and ATLAS ti which can be used for automatic coding text retrieval hyp linking of related text segments etc Some of these programs such as ATLAS ti or MAXqda even allow to represent the results of qualitative content analyses in graphical form as semantic networks of coded texts Sowa 1984 76 ff Lewins and Silver 2007 179 ff Such networks consist of 1 text segments or so called quotations which generally constitute a non overlapping partition of the analyzed text corpus 2 codes which are classificatory attributes of the mentioned text segments 3 links which are the result of the content analytic coding and describe the attribute relations between the mentioned codes and quotations

Attention and Time Kia Nobre, Jennifer Theresa Coull, 2010 Our ability to selectively attend to our surroundings taking notice of the things that matter and ignoring those that don t is crucial

if we are to efficiently negotiate the world around us. However, a number of factors influence just how and why we might pay attention to one thing but not another. An important and often neglected factor is time. For example, the temporal proximity between the appearance of two events might make us assume they are causally related in some way. We also know that the temporal space between the appearance of two related stimuli can be important if both are to be recognised. Then there are issues regarding our own perception of time passing and how this can itself be influenced by what we attend to. In comparison to the vast and long-standing literature on spatial aspects of attention, temporal aspects of attention have been relatively neglected. *Attention and Time* is the first book in years to explore this fascinating topic. It presents thirty chapters from internationally recognised experts in the field, carefully organised into three stand-alone yet extensively cross-referenced themed sections. Each section focuses on distinct ways in which attention and time influence one another. These sections, each encompassing a range of methodologies from classical cognitive psychology to single-cell neurophysiology, provide functionally unifying frameworks to help guide the reader through the many various experimental and theoretical approaches adopted. Section 1 considers variations of attention across time and explores how attentional allocation is limited by very short or very long intervals of time. Section 2 describes several types of temporal illusion, illustrating how attention can modulate the perception of the passage of time itself. A watched pot never boils and conversely time flies when you're having fun, nicely capture the experimental observation that the degree of attention allocated to stimulus timing contributes to its subjective duration. Finally, Section 3 examines how attention can be directed in time to predictable or expected moments in time so as to optimise behaviour. Bringing conceptually discrete yet functionally related fields of temporal attention research together within a single volume, this book provides a comprehensive overview that will be of value to the interested novice in cognitive neuroscience whilst also inspiring experts in the field to make perhaps previously overlooked links with their own field of research.

Human Memory Gabriel A. Radvansky, 2021-03-30 *Human Memory* 4th edition provides a comprehensive overview of research and theory on human memory. Written in an engaging style, the book is divided into three sections providing an accessible introduction to the application and assessment of memory theory. Beginning with the history of memory, the first section explores basic methodology and neuroscience. The second section examines the key topics of memory such as the sensory registers, mechanisms of forgetting and short-term nondeclarative, episodic and semantic memory. The third section focuses on specialist topics such as amnesia, memory for space and time, autobiographical memory, memory and reality, memory and the law, metamemory and formal models of memory. Instructors could pick and choose which of these chapters best fit the goals of their course. New to this edition: More prominent discussion of neuroscience findings. Coverage of a wider range of neuroscientific techniques. Greater emphasis on memory changes over time. New explanation of how to calculate a wider range of signal detection measures. Additional content on a wide range of topics including the mirror effect, sleep-related memory processes, vicarious autobiographical memories, inter-generational

memory transmission the impact of lying on memory eyewitness collaboration and aging and spatial memory Expanded coverage of areas including theories of hypermnesia chunking serial order memory prospective memory threshold models and eyewitness line up identification Updated companion resources including PowerPoint slides and exam questions The book highlights the application of memory theory and findings to everyday experience presents in depth explorations of studies and provides opportunities for students to explore the assessment of memory in more laboratory based settings Packed full of student friendly pedagogy including study questions Stop and Review and Try it Out sections Study in Depth text boxes and more Human Memory 4th edition is an essential companion for all students of human memory Motor Learning and Skill Acquisition Michael Spittle, 2021-03-03 Integrating theory with practice this core textbook provides a structured and sequential introduction to motor learning and motor control Part 1 begins by introducing what motor learning is and how movement is controlled before exploring how a learning environment may be manipulated to assist in the learning and performance of movement skills Part 2 explores motor control from neural behavioural and dynamic systems perspectives Part 3 provides an overview of considerations in applying motor learning and skill acquisition principles to physical education exercise and sports science Chapters are illustrated with flowcharts and diagrams to aid students understanding and include activities and end of chapter review questions to consolidate knowledge Motor Learning and Skill Acquisition is essential reading for all Physical Education Exercise and Sports Science and Sports Coaching students New to this Edition New and updated chapters on skill acquisition approaches talent identification and development and performance analysis and feedback as well as separate chapters on practice design and task modification and practice organisation and planning Contains additional content on decision making tactical and strategic skills traditional and constraints led skill acquisition approaches practice design and skill drill and game based practice for skill acquisition Supported by a bank of online lecturer resources including PowerPoints MCQs and lab activities Sensation and Judgment John C. Baird, 2014-02-25 Psychophysical theory exists in two distinct forms one ascribes the explanation of phenomena and empirical laws to sensory processes Context effects arising through the use of particular methods are an unwanted nuisance whose influence must be eliminated so that one isolates the true sensory scale The other considers psychophysics only in terms of cognitive variables such as the judgment strategies induced by instructions and response biases Sensory factors play a minor role in cognitive approaches This work admits the validity of both forms of theory by arguing that the same empirical phenomena should be conceptualized in two alternative apparently contradictory ways This acceptance of opposites is necessary because some empirical phenomena are best explained in terms of sensory processes while others are best ascribed to central causes The complementarity theory stresses the mutually completing nature of two distinct models The first assigns importance to populations of sensory neurons acting in the aggregate and is formulated to deal with sensory effects The second assigns importance to judgment uncertainty and to the subject strategies induced by experimental

procedures This model is formulated to explain context effects Throughout the text the exposition is interlaced with mathematics graphs and computer simulations designed to reveal the complementary nature of psychophysical explanations

A Matter of Bottom-Up or Top-Down Processes: The Role of Attention in Multisensory Integration Jess Hartcher-O'Brien, Salvador Soto-Faraco, Ruth Adam, 2017-07-04 The integration of information from various sensory modalities influences behaviour It can induce behavioural benefits such as faster reaction times and enhanced detection of noisy signals but may also produce illusions all of which have been characterized by specific neuronal signatures Yet while these effects of multisensory integration are largely accepted the role of attention in this process is still the object of intense debate On the one hand it has been suggested that attention may guide multisensory integration in a top down fashion by selection of specific inputs to be integrated out of the plethora of information in our environment On the other hand there is evidence that integration could occur in a bottom up manner based on temporal and spatial correlations and outside the focus of attention An extreme example is the multisensory enhancement of neural responses in anesthetised animals Attention itself is not a unitary construct and may refer to a range of different selection mechanisms Therefore the interplay between attention and multisensory integration can take many forms which explain in part the diversity of findings and the disputes in the literature The goal of this Research Topic is to help clarify the picture by trying to answer the following questions from various perspectives Under which circumstances does multisensory integration take place without attention and When does attention determine the fate of multisensory integration

Cortical Function: a View from the Thalamus V. A. Casagrande, Ray W. Guillery, S. Murray Sherman, 2005-10-17 Almost all of the messages that are received by the cerebral cortex from the environment or from the body's internal receptors come through the thalamus and much current thought about perceptual processing is based on sensory pathways that relay in the thalamus This volume focuses on three major areas the role of thalamocortical communication in cognition and attention the role of the thalamus in communication between cortical areas the hypothesis that much or all of the information relayed by thalamus even to classical pure sensory areas of cortex represents a corollary message being sent simultaneously to motor centers It presents a broad overview of important recent advances in these areas Provides a look at brain structures involved in perception and action Includes summaries by leading investigators in the field Presents recent advances in our understanding of brain functions

Attention and Performance XIV David E. Meyer, Sylvan Kornblum, 1993 Attention and Performance XIV provides a broad historic and timely synthesis of the empirical and theoretical ideas on which performance theory now rests

Understanding the Role of Time-Dimension in the Brain Information Processing Daya Shankar Gupta, Hugo Merchant, 2017-04-13 Optimized interaction of the brain with environment requires the four dimensional representation of space time in the neuronal circuits Information processing is an important part of this interaction which is critically dependent on time dimension Information processing has played an important role in the evolution of mammals and has

reached a level of critical importance in the lives of primates particularly the humans The entanglement of time dimension with information processing in the brain is not clearly understood at present Time dimension in physical world the environment of an organism can be represented by the interval of a pendulum swing the cover page depicts temporal unit with the help of a swinging pendulum Temporal units in neural processes are represented by regular activities of pacemaker neurons tonic regular activities of proprioceptors and periodic fluctuations in the excitability of neurons underlying brain oscillations Moreover temporal units may be representationally associated with time bins containing bits of information see the Editorial which may be studied to understand the entanglement of time dimension with neural information processing The optimized interaction of the brain with environment requires the calibration of neural temporal units Neural temporal units are calibrated as a result of feedback processes occurring during the interaction of an organism with environment Understanding the role of time dimension in the brain information processing requires a multidisciplinary approach which would include psychophysics single cell studies and brain recordings Although this Special Issue has helped us move forward on some fronts including theoretical understanding of calibration of time information in neural circuits and the role of brain oscillations in timing functions and integration of asynchronous sensory information further advancements are needed by developing correct computational tools to resolve the relationship between dynamic hierarchical neural oscillatory structures that form during the brain s interaction with environment

Handbook of Psychology, Experimental Psychology Alice F. Healy, Robert W. Mangun, 2012-02-16 This book will provide the reader with a solid overview of the mechanisms and models in the neuroscience of attentional control and selection from leading authorities working in humans and animals and incorporating a array of neuroscience methods from single neuron recordings to functional brain imaging

The Oxford Handbook of Eye Movements Simon Liversedge, Iain Gilchrist, Stefan Everling, 2011-08-18 In the past few years there has been an explosion of eye movement research in cognitive science and neuroscience This has been due to the availability of off the shelf eye trackers along with software to allow the easy acquisition and analysis of eye movement data Accompanying this has been a realisation that eye movement data can be informative about many different aspects of perceptual and cognitive processing Eye movements have been used to examine the visual and cognitive processes underpinning a much broader range of human activities including language production dialogue human computer interaction driving behaviour sporting performance and emotional states Finally in the past thirty years there have been real advances in our understanding of the neural processes that underpin eye movement behaviour The Oxford Handbook of Eye Movements provides the first comprehensive review of the entire field of eye movement research In over fifty chapters it reviews the developments that have so far taken place the areas actively being researched

and looks at how the field is likely to develop in the coming years The first section considers historical and background material before moving onto section 2 on the neural basis of eye movements The third and fourth sections look at visual cognition and eye movements and eye movement pathology and development The final sections consider eye movements and reading and language processing and eye movements Bringing together cutting edge research from an international team of leading psychologists neuroscientists and vision researchers this book is the definitive reference work in this field
