

What determines exercise blood pressure response across individuals?

Exercise BP responses are prognostic, but are highly variable in the population

- Study goal: To use maximal, symptom-limited exercise (CPET) and vascular tonometry across ≈2800 individuals to dissect mechanisms of inter-individual variation in exercise BP

Question 1:

How does the distribution of exercise BP vary by vascular stiffness and cardiac-peripheral exercise performance (O_2 pulse)?

Question 2:

Are there differences by sex?

Question 3:

How are measures of vascular stiffness and cardiac-peripheral performance related to BP at different phases of exercise?

BP Responses Throughout Exercise

Determinants of BP

Clinical implication:
Determining mechanisms of inter-individual variability in exercise BP can improve clinical BP assessment and identify individuals at higher vascular risk

rest and a final 4 5 d of ambulatory recovery Their diet consisted of commonly available fresh and frozen foods mean caloric consumption of 2 678 SE 75 kcal d control 2 833 SE 82 kcal day isotonic and 2 890 SE 75 kcal d isokinetic resulted in mean weight losses during bed rest of 1 01 kg 0 85 kg and 0 0 kg respectively The results indicated that 1 The subjects maintained a relatively stable mood high morale and high esprit de corps throughout the study Scores improved in nearly all performance and mood tests in almost all the subjects Isotonic training as opposed to isokinetic exercise training was associated with decreasing levels of psychological tension concentration and motivation and with improvement in the quality of sleep 2 Peak oxygen uptake was maintained during bed rest with isotonic exercise training it was not maintained as well with isokinetic 9 0% or no exercise 18 2% training If a 9% reduction in aerobic power is acceptable isokinetic exercise training could be used for maintenance of strength endurance and the reduced aerobic capacity in astronauts during flight 3 In general there were few decreases in strength or endurance of arm or leg muscles during bed rest in spite of reduction in size atrophy of some leg muscles 4 There was no effect of isotonic or isokinetic exercise training on orthostasis because tilt table tolerances were reduced similarly from 42 53 min to 30 34 min in the three groups following bed rest 5 Bed rest resulted in significant decreases of postural stability and self selected step length stride length and walking velocity which were not influenced by either exercise training regimen Pre bed rest responses were restored by the fourth day of recovery
