A Thin-shock-layer Solution for Nonequilibrium, Inviscid Hypersonic Flows in Earth, Martian, and Venusian Atmospheres William L. Gose,1971 An approximate inverse solution is presented for the nonequilibrium flow in the inviscid shock layer about a vehicle in hypersonic flight The method is based upon a thin shock layer approximation and has the advantage of being applicable to both subsonic and supersonic regions of the shock layer The relative simplicity of the method makes it ideally suited for programming on a digital computer with a significant reduction in storage capacity and computing time required by other more exact methods Comparison of nonequilibrium solutions for an air mixture obtained by the present method is made with solutions obtained by two other methods Additional cases are presented for entry of spherical nose cones into representative Venusian and Martian atmospheres A digital computer program written in FORTRAN language is presented that permits an arbitrary gas mixture to be employed in the solution The effects of vibration dissociation recombination electronic excitation and ionization are included in the program **Proceedings of the ASME Advanced Energy Systems Division** American Society of Mechanical Engineers.
