Monitoring David J. Marchette, 2013-04-17 In the fall of 1999 I was asked to teach a course on computer intrusion detection for the Department of Mathematical Sciences of The Johns Hopkins University That course was the genesis of this book I had been working in the field for several years at the Naval Surface Warfare Center in Dahlgren Virginia under the auspices of the SHADOW program with some funding by the Office of Naval Research In designing the class I was concerned both with giving an overview of the basic problems in computer security and with providing information that was of interest to a department of mathematicians Thus the focus of the course was to be more on methods for modeling and detecting intrusions rather than one on how to secure one's computer against intrusions The first task was to find a book from which to teach I was familiar with several books on the subject but they were all at either a high level focusing more on the political and policy aspects of the problem or were written for security analysts with little to interest a mathematician I wanted to cover material that would appeal to the faculty members of the department some of whom ended up sitting in on the course as well as providing some interesting problems for students None of the books on the market at the time had an adequate discussion of mathematical issues related to intrusion detection **Encyclopedia of Multimedia Technology and Networking,**

Software Evangelism and the Rhetoric of Morality Jennifer Helene Maher, 2015-08-27 Examining the layers of meaning encoded in software and the rhetoric surrounding it this book offers a much needed perspective on the intersections between software morality and politics In software development culture evangelism typically denotes a rhetorical practice that aims to convert software developers as

well as non technical lay users from one platform to another e g from the operating system Microsoft Windows to Linux This book argues that software evangelism like its religious counterpart must also be understood as constructing moral and political values that extend well beyond the boundaries of the development culture Unlike previous studies that locate such values in the effects of code in use or in certain types of code like free and open source FOSS software Maher argues that all code is meaningful beyond its technical executable functions To facilitate this analysis this study builds a theory of evangelism and illustrates this theory at work in the proprietary software industry and FOSS communities As an example of political liberalism at work at the level of code these evangelical rhetorics of software construct competing conceptions of what is good that fall within a shared belief in what is just Maher illustrates how these beliefs in goodness and justice do not always execute in replicable ways as the different ways of decoding software evangelisms in the contexts of Brazil and China reveal Demonstrating how software evangelisms exert a transformative force on the world one comparable in significance to code itself this book highlights the importance of rhetoric in even the most seemingly a rhetorical of technical endeavors and foregrounds the crucial need for rhetorical literacy in the digital age
