Reasoning About Actions And Plans Proceedings:

Reasoning about Actions & Plans American Association for Artificial Intelligence, Center for the Study of Language and Information (U.S.), 1987 Reasoning About Actions Plans **Situation Theory and Its Applications: Volume 3** Robin Cooper, Peter Aczel, Kuniaki Mukai, John Perry, 1990 Situation theory is the result of an interdisciplinary effort to create a full fledged theory of information. Created by scholars and scientists from cognitive science, computer science and AI, linguistics, logic, philosophy, and mathematics, it aims to provide a common set of tools for the analysis of phenomena from all these fields. Unlike Shannon-Weaver type theories of information which are purely quantitative, situation theory aims at providing tools for the analysis of the specific content of a situation signal message, data base statement or other information carrying situation. The question addressed is not how much information is carried but what information is carried. Current Trends in AI Planning Christer Bäckström, Erik Sandewall, 1994 AI planning is a broad research topic linked with such issues as robotics, control theory, operations research, and learning. The purpose of EWSP 93 was twofold: Planning under certainty or classical search based planning is one direction in the submitted papers, with approaches ranging from the introduction of conditional actions to methods based on statistics and decision theory. Computational Theories of Interaction and Agency Philip Agre, Stanley J. Rosenschein, 1996 Over time, the field of artificial intelligence has developed an agent perspective, expanding its focus from thought to action, from search spaces to physical environments, and from problem solving to long-term activity. Originally published as a special double volume of the journal Artificial Intelligence, this book brings together fundamental work by the top researchers in artificial intelligence, neural networks, computer science, robotics, and cognitive science, on the themes of interaction and agency. It identifies recurring themes and outlines a methodology of the concept of agency. The seventeen contributions cover the construction of principled characterizations of interactions between agents and their environments, as well as the use of these characterizations to guide analysis of existing agents and the synthesis of artificial agents. Artificial Intelligence series Special Issues of Artificial Intelligence **Rules of Encounter** Jeffrey S. Rosenschein, Gilad Zlotkin, 1994 Provides a unified, coherent account of machine interaction at the level of the machine designers, the society of designers, and the level of the machine interaction itself. The resulting artificial society, Rules of Encounter, applies the general approach and the mathematical tools of game theory in a formal analysis of rules or protocols governing the high-level behavior of interacting heterogeneous computer systems. It describes a theory of high-level protocol design that can be used to constrain manipulation and harness the potential of automated negotiation and coordination strategies to attain more effective interaction among machines that have been programmed by different entities to pursue different goals. While game theoretic ideas have been used to answer the question of how a computer should be programmed to act in a given specific interaction, here they are used in a new way to address the question of how to design the rules of interaction themselves for automated agents. Rules of Encounter provides a unified, coherent account of machine interaction.

at the level of the machine designers the society of designers and the level of the machine interaction itself the resulting artificial society Taking into account such attributes of the artificial society as efficiency and the self interest of each member in the society of designers it analyzes what kinds of rules should be instituted to govern interaction among these autonomous agents The authors point out that adjusting the rules of public behavior or the rules of the game by which the programs must interact can influence the private strategies that designers set up in their machines shaping design choices and run time behavior as well as social behavior Artificial Intelligence series

Computational Logic: Logic Programming and Beyond

Antonis C. Kakas,Fariba Sadri,2003-08-02 Alan Robinson This set of essays pays tribute to Bob Kowalski on his 60th birthday an anniversary which gives his friends and colleagues an excuse to celebrate his career as an original thinker a charismatic communicator and a

forceful intellectual leader The logic programming community hereby and herein conveys its respect and thanks to him for his pivotal role in creating and fostering the conceptual paradigm which is its *raison d'être* The diversity of interests covered here reflects the variety of Bob's concerns Read on It is an intellectual feast Before you begin permit me to send him a brief personal but public message Bob how right you were and how wrong I was I should explain When Bob arrived in Edinburgh in 1967 resolution was as yet fairly new having taken several years to become at all widely known Research groups to investigate various aspects of resolution sprang up at several institutions the one organized by Bernard Meltzer at Edinburgh University being among the first For the half dozen years that Bob was a leading member of Bernard's group I was a frequent visitor to it and I saw a lot of him We had many discussions about logic computation and language

Knowledge in Action

Raymond Reiter, 2001-07-27 Specifying and implementing dynamical systems with the situation calculus Modeling and implementing dynamical systems is a central problem in artificial intelligence robotics software agents simulation decision and control theory and many other disciplines In recent years a new approach to representing such systems grounded in mathematical logic has been developed within the AI knowledge representation community This book presents a comprehensive treatment of these ideas basing its theoretical and implementation foundations on the situation calculus a dialect of first order logic Within this framework it develops many features of dynamical systems modeling including time processes concurrency exogenous events reactivity sensing and knowledge probabilistic uncertainty and decision theory It also describes and implements a new family of high level programming languages suitable for writing control programs for dynamical systems Finally it includes situation calculus specifications for a wide range of examples drawn from cognitive robotics planning simulation databases and decision theory together with all the implementation code for these examples

This code is available on the book's Web site *Principles of Semantic Networks* John F. Sowa, 2014-07-10 Principles of Semantic Networks Explorations in the Representation of Knowledge provides information pertinent to the theory and applications of semantic networks This book deals with issues in knowledge representation which discusses theoretical topics independent of particular implementations Organized into three parts encompassing 19 chapters this book begins with an overview of semantic network structure for representing knowledge as a pattern of interconnected nodes and arcs This text then analyzes the concepts of subsumption and taxonomy and synthesizes a framework that integrates many previous approaches and goes beyond them to provide an account of abstract and partially defined concepts Other chapters consider formal analyses which treat the methods of reasoning with semantic networks and their computational complexity This book discusses as well encoding linguistic knowledge The final chapter deals with a formal approach to knowledge representation that builds on ideas originating outside the artificial intelligence literature in research on foundations for programming languages This book is a valuable resource for mathematicians

Practical Planning

David E. Wilkins,2014-06-28 Planning or reasoning about actions is a fundamental element of intelligent behavior and one that artificial intelligence has found very difficult to implement The most well understood approach to building planning systems has been under refinement since the late 1960s and has now reached a level of maturity where there are good prospects for building working planners Practical Planning is an in depth examination of this classical planning paradigm through an intensive case study of SIPE a significantly implemented planning system The author the developer of SIPE defines the planning problem in general explains why reasoning about actions is so complex and describes all parts of the SIPE system and the algorithms needed to achieve efficiency Details are discussed in the context of problems and important issues in building a practical planner discussions of how other systems address these issues are also included Assuming only a basic background in AI Practical Planning will be of great interest to professionals interested in incorporating planning capabilities into AI systems
