Bautista, 2013-12-19 The mineral resources of the industrialized countries especially the member nations of the North Atlantic Treaty Organiza tion are being

depleted at such a rate that more and more of these countries are beginning to depend on ore imported from other countries. To sustain the economic and strategic well-being of these member countries it becomes imperative that a program of developing and exploiting other non-conventional mineral resources and a conservation program where metal values from waste dumps and scrap metals and alloys are recycled must be initiated and implemented. In order to meet this challenge new processes and technology must be available for consideration in the design and operation of the new plants. One of the possible routes of extracting the metals from their ores especially for multimetal complex ores and very low grade ores is by hydrometallurgical processing. The hydrometallurgical route of metal recovery where dissolution leaching separation and concentration ion exchange solvent extraction and membrane separation and reduction to metal cementation precipitation by gaseous reduction and electrolysis is carried out at near ambient temperature is becoming more competitive with the conventional high temperature processes used in the smelting of metals from high grade and beneficiated ores.
