Recent Advances In Mechanistic And Synthetic Aspects Of Polymerization:

Recent Advances in Mechanistic and Synthetic Aspects of Polymerization M. Fontanille, A. Guyot, 2012-12-06 Due to their specific properties polymers with well defined structures have been receiving increasing attention over the last several years. Owing to the wide variability of their properties these specialty polymers have been used in various areas from biomedical engineering to electronics or energy applications. The synthesis of such polymers necessitates the use of new methods of polymerization which derived from an insight into the mechanism of polymerization reactions. A NATO Advanced Research Workshop on Frontiers in Polymerization Catalysis and Polymer Synthesis was held in BANDOL FRANCE in February 1987. Its aim was to assess the new polymerization methods as well as the latest advances in the mechanisms of conventional polymerization reactions together with their applications to the synthesis of new macromolecular structures. The financial support from the NATO Scientific Affairs Division which covered the lecturers accommodation and travel expenses as well as the organization charges of this event gave it international scope. Several industrial companies participate at the meeting and contributed to its success. The organizers who are also editors of these proceedings want to express their thanks to both NATO Scientific Affairs Division and the companies present at the meeting.

Recent Advances in Mechanistic and Synthetic Aspects of Polymerization M. Fontanille, A. Guyot, 1987-10-31 **New Methods of Polymer Synthesis** J. R. Ebdon, 2012-12-06 Most practitioners and students of polymer chemistry are familiar in general terms at least with the established methods of polymer synthesis: radical, anionic, cationic and coordination addition polymerization and stepwise condensation and rearrangement polymerization. These methods are used to synthesize the majority of polymers used in the manufacture of commercially important plastics, fibres, resins and rubbers and are covered in most introductory polymer chemistry textbooks and in most undergraduate and graduate courses on polymer science. Fewer polymer chemists however have much familiarity with more recent developments in methods of polymer synthesis unless they have been specifically involved for some time in the synthesis of specialty polymers. These developments include not only refinements to established methods but also new mechanisms of polymerization such as group transfer and metathesis polymerization and novel non polymerization routes to specialty polymers involving for example the chemical modification of preformed polymers or the linking together of short terminally functionalized blocks.
