**Biotechnological Applications of Lipid Microstructures** B. P. Gaber, 2012-12-06 In the twenty years since Bangham first described the model membrane system which he named liposomes a generation of scientists have explored the properties of lipid based microstructures Liposomes of all sizes tubular and helical structures and self assembled lipid films have been prepared and studied in detail Many of the advances in the basic research have led to significant technological applications Lipid microstructure research has begun to mature and it is an appropriate time for an in depth look at the biotechnological applications both achieved and potential As a forum for active discussions within this growipg field two Workshops were organized Technological Applications of Phospholipid Bilayers Vesicles and Thin Films held in Puerto de la Cruz Tenerife Canary Islands and Biotechnological Applications of Membrane Studies held in Donostia San Sabastian Basque Country Spain The organizers of these Workshops believe that development of lipid self assembly into a technological discipline requires significant interaction across traditional scientific boundaries Thus the Workshops gathered an eclectic group of colleagues whose interests ranged from basic research into structure interactions and stabilization of biomembranes to applications of lipid microstructures such as artificial cells diagnostic reagents energy transfer systems and biosensors

**Hydrometallurgical Process Fundamentals** Renato G. Bautista, 2013-12-19 The mineral resources of the industrialized countries especially the member nations of the North Atlantic Treaty Organiza tion are being

depleted at such a rate that more and more of these countries are beginning to depend on ore imported from other countries. To sustain the economic and strategic well being of these member countries it becomes imperative that a program of developing and exploiting other non conventional mineral resources and a conservation program where metal values from waste dumps and scrap metals and alloys are recycled must be initiated and implemented. In order to meet this challenge new processes and technology must be available for consideration in the design and operation of the new plants. One of the possible routes of extracting the metals from their ores especially for multimetal complex ores and very low grade ores is by hydrometallurgical processing. The hydrometallurgical route of metal recovery where dissolution leaching separation and concentration ion exchange solvent extraction and membrane separation and reduction to metal cementation precipitation by gaseous reduction and electrolysis is carried out at near ambient temperature is becoming more competitive with the conventional high temperature processes used in the smelting of metals from high grade and beneficiated ores.
