## **Recent Progress In The Genetic Epidemiology Of Cancer:**

*Recent Progress in the Genetic Epidemiology of Cancer* Henry T. Lynch, Petre Tautu, 2012-12-06 The discipline of genetic epidemiology pertains to the vertical transmission of the susceptibility predisposition to a complex disease in a structured population This statement meets halfway 1 the broad definition given by N E Morton and S c Chung in 1978 2 and the concise one given by M C King et al in 1984 1t pinpoints the fundamental genetic hypothesis namely the existence of an inherited condition that predisposes an individual to a specific disease and the corresponding subject of investigation the family Thus the genetic epidemiological situation consists of three basic elements 1 the genealogical structure 2 the mode of inheritance 3 the genetic model for the trait of interest and 3 the observable phenotypes of susceptibility It is clear that genetic epidemiology is a research field positioned at the intersection of molecular genetics population genetics and clinical genetics Perhaps the genealogical tree should be its central element it evidences something forgotten in molecular genetics namely the relationships and associations with probabilistic and statistical concepts from population genetics It offers a structure and a history for those clinicians studying familial diseases who are searching for genetic determinants of susceptibility The genetic epidemiologist begins his analysis with a point on this genealogical tree namely the proband and attempts to carry out nonrandom ascertainment sampling by using a strategy that depends on the form and dimension extended pedigrees versus nuclear families of the tree
