Today organocatalysis has been a powerful technology for organic synthesis. In addition to the applications in organic synthesis and catalysis, organocatalysis has also been used in the production of enantiomers in fine chemistry, pharmaceutical crop protection and fragrance chemistry. As one important type of organic catalyst, N-heterocyclic carbenes (NHCs) have broad applications in organic synthesis. Inspired by the natural coenzyme thiamine (vitamin B1), catalysis chemists developed various NHCs and used them to catalyze a broad variety of transformations including benzoin reaction, Stetter reaction, homoenolate transformations, redox reactions, cycloadditions, photo reactions and other reactions. On the other hand, aldol condensation reaction is one of the most important reactions for the construction of carbon-carbon bonds. Based on the unique Lewis basicity of NHCs, we and other groups realized efficient activation of different silylated nucleophiles and developed a variety of aldol-type reactions of carbonyl compounds. As a result, different functionalized alcohols and their derivatives were prepared through NHC catalysis. This book can be used as a reference for scholars, graduate students and researchers in the field of organic chemistry, fine chemistry and drug synthesis.
