Pearls of Glaucoma Management JoAnn A. Giaconi, Simon K. Law, Anne L. Coleman, Joseph Caprioli, 2010-03-02 If you have ever uttered the commonly expressed lament Glaucoma is so confusing then this text is for you You will no longer be bewildered Why practitioners may be confused about how to be of help to patients with glaucoma in its many incarnations and reincarnations is easily understood The issue seems to be overwhelming when one considers that the already massive population of those with glaucoma is increasing rapidly as the world s population increases and ages During the past 50 years the fundamental definition of glaucoma has changed almost 180 and the indications for treatment have become more variable and controversial some advising early therapy and others strongly cautioning against such an approach Various diagnostic tests have come and gone and are interpreted in such different ways that there seems to be no consensus surgical techniques come in and out of fashion in perplexing ways There seems to be a constantly shifting sandy foundation on which are built unsteady schools of ever varying advice Why practitioners patients and the public are often bewildered is understandable

Digital Image Processing for Ophthalmology Xiaolu Zhu,Rangaraj Rangayyan,Anna L. Ells,2011-02-02 Fundus images of the retina are color images of the eye taken by specially designed digital cameras Ophthalmologists rely on fundus images to diagnose various diseases that affect the eye such as diabetic retinopathy and retinopathy of prematurity A crucial preliminary step in the analysis of retinal images is the identification and localization of important anatomical structures such as the optic nerve head ONH the macula and the major vascular arcades Identification of the ONH is an important initial step in the detection and analysis of the anatomical structures and pathological features in the retina Different types of retinal pathology may be detected and analyzed via the application of appropriately designed techniques of digital image processing and pattern recognition Computer aided analysis of retinal images has the potential to facilitate quantitative and objective analysis of retinal lesions and abnormalities Accurate identification and localization of retinal features and lesions could contribute to improved diagnosis treatment and management of retinopathy This book presents an introduction to diagnostic imaging of the retina and an overview of image processing techniques for ophthalmology In particular digital image processing algorithms and pattern analysis techniques for the detection of the ONH are described In fundus images the ONH usually appears as a bright region white or yellow in color and is indicated as the convergent area of the network of blood vessels Use of the geometrical and intensity characteristics of the ONH as well as the property that the ONH represents the location of entrance of the blood vessels and the optic nerve into the retina is demonstrated in developing the methods The image processing techniques described in the book include morphological filters for preprocessing fundus images filters for edge detection the Hough transform for the detection of lines and circles Gabor filters to detect the blood vessels and phase portrait analysis for the detection of convergent or node like patterns Illustrations of application of the methods to fundus images from two publicly available databases are presented in terms of locating the center and the boundary of the ONH Methods for quantitative evaluation of the results of detection of the ONH using measures of overlap and free response receiver operating characteristics are also described Table of Contents Introduction Computer aided Analysis of Images of the Retina Detection of Geometrical Patterns Datasets and Experimental Setup Detection of the Optic Nerve Head Using the Hough Transform Detection of the Optic Nerve Head Using Phase Portraits Concluding Remarks
