the artificial intelligence community is generally acknowledged to be a useful categorization and has started to gain widespread acceptance We therefore define a mobile agent as a program that acts on behalf of a user or another program and is able to migrate from host to host on a network under its own control The agent chooses when and where it will migrate and may interrupt its own execution and continue elsewhere on the network The agent returns results and messages in an asynchronous fashion This volume discusses the emerging field of mobile software agents and their applications to the area of telecommunications such as active networks e commerce the Internet interactive QoS network management and feature interactions It addresses the needs of a wide audience including researchers software agent systems and telecommunication applications designers and users of software agents

Biomass Utilization: Conversion Strategies

Nhuan Phu Nghiem, Tae Hyun Kim, Chang Geun Yoo, 2022-08-20 This book focuses on the technologies developed for the conversion of all three biomass components i e cellulose hemicellulose and lignin and their constituents to fuels and high value products Both biochemical and thermochemical approaches are reviewed Additionally the developed technologies are described in detail and their potential applications as well as their commercial status are discussed The early attempts to produce fuel ethanol from lignocellulosic biomass feedstock focused solely on the biological conversion of cellulose because the only organism that had been used successfully for commercial production of ethanol i e *Saccharomyces cerevisiae* could only ferment glucose which was obtained from the hydrolysis of cellulose Hemicellulose and lignin were considered as wastes in these processes and were normally removed in pretreatment processes to enhance enzymatic hydrolysis of the remaining cellulose However this approach was not economically feasible and as a result the biorefinery concept was developed In a biorefinery in addition to ethanol various higher value products are produced from hemicellulose and lignin which were previously not considered Consequently technologies were developed for the fractionation of biomass and conversion of hemicellulose and lignin to fuels and high value products to improve the economic feasibility Written and edited by a team of investigators with many years of experience in biomass processing research and development this book is an informative resource for postgraduate students and researchers interested in biorefinery and biofuel technologies both in academia and commercial laboratories
