Lampropoulos,George A. Tsihrintzis,2015-06-13 This timely book presents Applications in Recommender Systems which are making recommendations using machine learning algorithms trained via examples of content the user likes or dislikes Recommender systems built on the assumption of availability of both positive and negative examples do not perform well when negative examples are rare It is exactly this problem that the authors address in the monograph at hand Specifically the books approach is based on one class classification methodologies that have been appearing in recent machine learning research The blending of recommender systems and one class classification provides a new very fertile field for research innovation and development with potential applications in big data as well as sparse data problems The book will be useful to researchers practitioners and graduate students dealing with problems of extensive and complex data It is intended for both the expert researcher in the fields of Pattern Recognition Machine Learning and Recommender Systems as well as for the general reader in the fields of Applied and Computer Science who wishes to learn more about the emerging discipline of Recommender Systems and their applications Finally the book provides an extended list of bibliographic references which covers the relevant literature completely *Fusion of Machine Learning Paradigms* Ioannis K. Jain,2023-02-06 This book aims at updating the relevant computer science related research communities including professors researchers scientists engineers and students as well as the general reader from other disciplines on the most recent advances in applications of methods based on Fusing Machine Learning Paradigms Integrated or Hybrid Machine Learning methodologies combine together two or more Machine Learning approaches achieving higher performance and better efficiency when compared to those of their constituent components and promising major impact in science technology and the society The book consists of an editorial note and an additional eight chapters and is organized into two parts namely i

Recent Application Areas of Fusion of Machine Learning Paradigms and ii Applications that can clearly benefit from Fusion of Machine Learning Paradigms This book is directed toward professors researchers scientists engineers and students in Machine Learning related disciplines as the hybridism presented and the case studies described provide researchers with successful approaches and initiatives to efficiently address complex classification or regression problems It is also directed toward readers who come from other disciplines including Engineering Medicine or Education Sciences and are interested in becoming versed in some of the most recent Machine Learning based technologies Extensive lists of bibliographic references at the end of each chapter guide the readers to probe further into the application areas of interest to them **Machine**

Learning Paradigms Dionisios N. Sotiropoulos, George A. Tsihrintzis, 2016-10-26 The topic of this monograph falls within the so called biologically motivated computing paradigm in which biology provides the source of models and inspiration towards the development of computational intelligence and machine learning systems Specifically artificial immune systems are presented as a valid metaphor towards the creation of abstract and high level representations of biological components or functions that lay the foundations for an alternative machine learning paradigm Therefore focus is given on addressing the primary problems of Pattern Recognition by developing Artificial Immune System based machine learning algorithms for the problems of Clustering Classification and One Class Classification Pattern Classification in particular is studied within the context of the Class Imbalance Problem The main source of inspiration stems from the fact that the Adaptive Immune System constitutes one of the most sophisticated biological systems that is exceptionally evolved in order to continuously address an extremely unbalanced pattern classification problem namely the self non self discrimination process The experimental results presented in this monograph involve a wide range of degenerate binary classification problems where the minority class of interest is to be recognized against the vast volume of the majority class of negative patterns In this context Artificial Immune Systems are utilized for the development of personalized software as the core mechanism behind the implementation of Recommender Systems The book will be useful to researchers practitioners and graduate students dealing with Pattern Recognition and Machine Learning and their applications in Personalized Software and Recommender Systems It is intended for both the expert researcher in these fields as well as for the general reader in the field of Computational Intelligence and more generally Computer Science who wishes to learn more about the field of Intelligent Computing Systems and its applications An extensive list of bibliographic references at the end of each chapter guides the reader to probe further into application area of interest to him her **Machine Learning Methods for Ecological Applications**

Alan H. Fielding, 2012-12-06 It is difficult to become an ecologist without acquiring some breadth For example we are expected to be competent statisticians and taxonomists who appreciate the importance of spatial and temporal processes whilst recognising the potential offered by techniques such as RAPD It is therefore with some trepidation that we offer a collection of potentially useful methods that will be unfamiliar and possibly alien to most ecologists I don't feel old but when I

was undertaking my postgraduate research our lab calculator was mechanical There was great excitement in my final year when we obtained an unbelievably expensive electronic calculator Later I progressed to running obs on a PRIME minicomputer via a collection of punched cards Those who complain about the problems with current computers don't know how lucky they are In 1984 I wrote a book entitled Computing for Biologists Although it was mainly concerned with writing short programs it did also look at wider aspects of the role of computers in the biological sciences Machine learning was not mentioned in that book probably because of ignorance but also because the methods were relatively unknown outside of the relatively small number of workers in the broad field that is now known as machine learning During 1985 I spent a sabbatical year at York University following their Biological Computation masters programme This course was a unique blend of computer science mathematics and statistics
