

when the appropriate single-diode circuit is closed. The detector stage, containing the four tuning capacitors, indicates that these capacitors are present. A small vacuum capacitor is connected to capacitor units and centers of the present tuning capacitors for impedance adjustment in the circuit. These small vacuum capacitors are for impedance adjustment of the circuit elements. The detector stage is considered as a diode, since the grid and the plate are connected together. Figure 112 is a circuit diagram of the detector stage.

3. In Figure 113, all grids of the T-F receiver are grounded, as shown, potential are denoted by heavy lines. All points on the heavy ground line will be at the same potential, which is considered to be zero with respect to the rest of the receiver circuit. All voltages in the circuit are compared to this ground potential.

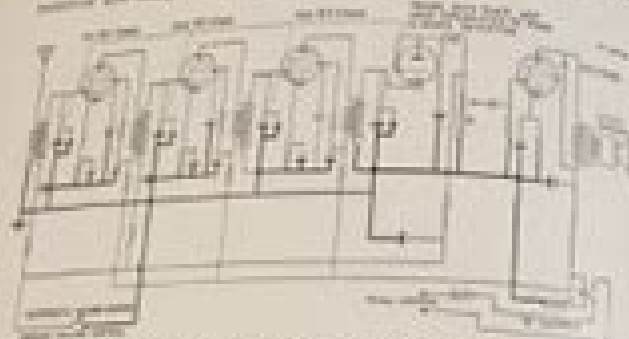

Figure 113. T-F receiver, Grounded potential elements denoted by heavy lines.

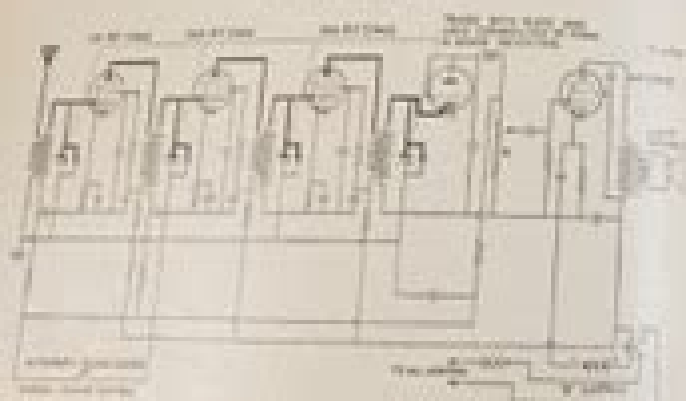

Figure 114. T-F receiver, Elements at high $r-f$ potential denoted by heavy lines.

4. In Figure 115, all of the elements of the T-F receiver at high $r-f$ potential are denoted by heavy lines. The source of the electron is a cathode ray tube, the path of the $r-f$ signal from the antenna down to the diode detector.

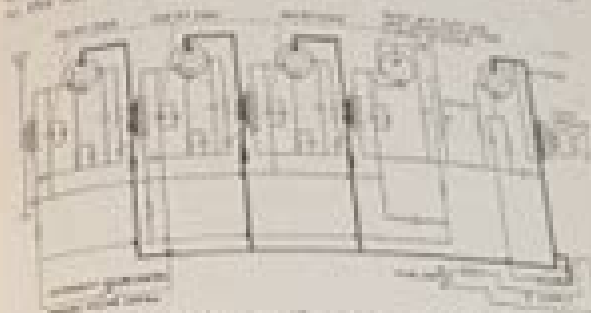

Figure 115. T-F receiver, Plate supply source by heavy lines.

5. In Figure 116, the high voltage for plate supply is shown by heavy lines. When the switch is closed, the first pentode receives the high positive plate voltage necessary for their action as amplifiers. The diode operating as a detector, does not require the plate voltage. The first pentode's operation in the plate supply of the first stage provides.

6. In Figure 117, the complete detector circuit is shown in heavy lines. The tube used in this stage is considered to be a diode. The grid and the plate of the triode are connected, or tied together, resulting in a two-element tube, or diode. The rectified or detected signal is taken
