

Luminescence in solids

- Luminescence is a property of solids where light is produced from electrons “trapped” in crystal lattice defects.
- These electrons become trapped with exposure to background radiation and escape these traps when given energy through sunlight.

Kröger, 1948 INTRODUCTION TO LUMINESCENCE OF SOLIDS NEW YORK, 1950 **Luminescence and the Solid State** Richard C. Ropp, 2004-05-06 Since the first date of publication of this book in 1991 the subject of phosphors and luminescence has assumed even more importance in the overall scheme of technological development Many new types of displays have appeared which depend upon phosphors in their operation Some of these were pure conjecture in 1991 but are a reality in 2004 Descriptions have been included of the newer as well as the older types of displays in this edition along with an annotated portrait of the phosphors used in each category Many of these new light sources promise to displace and make obsolete our current light sources such as incandescent lamps fluorescent lamps and the ubiquitous colour Cathode Ray Tube now used in TV and computer monitors The importance of solid state science are summarized in the introductory chapters of this edition and many of the chapters have been completely rewritten or revised Each chapter has a special contribution to make in the overall understanding of the solid state science of phosphors and luminescence Introduces the reader to the science and art of preparing inorganic luminescent materials Describes how and why luminescent materials exhibit such specific intrinsic properties Describes the science of the solid state and presents the exact formulas and conditions required to make all of the phosphors known at that time *Some New Experimental Results and Theoretical Interpretations in the Luminescence of Solids* Ferd Elton Williams, 1947 *Luminescence of Solids Produced by Surface Recombination of Atoms* KENNETH M. Theory of Thermoluminescence and Related Phenomena Reuven Chen, S. W. S. McKeever, 1997 In this book the authors give an up to date account of thermoluminescence TL and other thermally stimulated phenomena Although most recent experimental results of TL in different materials are described in some detail the main emphasis in the present book is

on general processes and the approach is more theoretical. Thus the details of the possible processes which can take place during the excitation of the sample and during its heating are carefully analysed. The methods for analysing TL glow curves are critically discussed and recommendations as to their application are made. Also discussed is the expected behavior of these phenomena as functions of the experimental parameters for example dose of excitation. The consequences of the main applications of TL for example radiation dosimetry are also discussed in detail as are the similarities and dissimilarities of other thermally stimulated phenomena and the simultaneous measurements of the latter and TL.

Luminescence of Liquids and Solids and Its Practical Applications Peter Pringsheim, Marcel Vogel, 1946 **Luminescence of Inorganic Solids** B. Bartolo, 2012-12-06

These proceedings report the lectures and seminars of a course entitled Luminescence of Inorganic Solids held at Erice Italy June 15-30 1977. This course was an activity of the International School of Atomic and Molecular Spectroscopy of the Ettore Majorana Centre for Scientific Culture. The course opened with an overview of the present status of luminescence research and with an assessment of its future trends. The following lectures introduced the basic formalism behind the interaction of matter with the radiation field and the lattice phonons. The luminescence properties of various classes of inorganic materials were treated next for the specific cases of unfilled shell activators transition metal lanthanide and actinide ions and filled s¹ activators s² and d¹⁰ ions. Different models suitable for the description of the luminescence properties of semiconductors were examined next. The dynamics of energy transfer and relaxation in the excited state of the activators were treated in lectures devoted to the luminescence phenomena of sensitization concentration quenching and thermal quenching. Finally the relevance of luminescence studies to the field of phosphor technology and to the laser field was examined. Each lecturer began the treatment of this topic at a fundamental level and finally reached the current level of research. The sequence of the lectures was determined by the requirements of a didactical presentation. The emphasis of the course was primarily on basic principles. The formal lectures were complemented by seminars and discussions.

Luminescence in Solids Containing Manganese, 1940 *Solid State Luminescence* A.H. Kitai, 2012-12-06 Historically black body radiation in the tungsten filament lamp was our primary industrial means for producing artificial light as it replaced gas lamps Solid state luminescent devices for applications ranging from lamps to displays have proliferated since then particularly owing to the development of semiconductors and phosphors Our lighting products are now mostly phosphor based and this cold light is replacing an increasing fraction of tungsten filament lamps Even light emitting diodes now challenge such lamps for automotive brake lights In the area of information displays cathode ray tube phosphors have proved themselves to be outstandingly efficient light emitters with excellent colour capability The current push for flat panel displays is quite intense and much confusion exists as to where development and commercialization will occur most rapidly but with the need for colour it is now apparent that solid state luminescence will play a primary role as gas phase plasma displays do not conveniently permit colour at the high resolution needed today The long term challenge to develop electroluminescent displays continues and high performance fluorescent lamps currently illuminate liquid crystal monochrome and colour displays The development of tri

Solid-State Spectroscopy Hans Kuzmany, 2013-03-09

Spectroscopic methods have opened up a new horizon in our knowledge of solid state materials. Numerous techniques using electromagnetic radiation or charged and neutral particles have been invented and worked out to a high level in order to provide more detailed information on the solids. In this text, new radiation sources like lasers and synchrotrons are discussed. It provides a description of the linear response together with the basic principles and the technical background for various scattering experiments. Fourier transform spectroscopy, pulsed and magnetic NMR techniques, photo emission and light and electron scattering are elucidated. Each chapter includes problems. The concept of this textbook is designed for graduate students.
