Machine Learning Proceedings 1989 Inductive Logic Programming Stephen Muggleton, 1992 Inductive logic programming is a new research area emerging at present Whilst inheriting various positive characteristics of the parent subjects of logic programming and machine learning it is hoped that the new area will overcome many of the limitations of its forbears This book describes the theory implementations and applications of Inductive Logic Programming

Machine Learning Ryszard S. Michalski, George Tecuci, 1994-02-09 Multistrategy learning is one of the newest and most promising research directions in the development of machine learning systems The objectives of research in this area are to study trade offs between different learning strategies and to develop learning systems that employ multiple types of inference or computational paradigms in a learning process Multistrategy systems offer significant advantages over monostrategy systems They are more flexible in the type of input they can learn from and the type of knowledge they can acquire As a consequence multistrategy systems have the potential to be applicable to a wide range of practical problems This volume is the first book in this fast growing field It contains a selection of contributions by leading researchers specializing in this area

See below for earlier volumes in the series Machine Learning Proceedings 1991 Lawrence A. Birnbaum, Gregg C. Collins, 2014-06-28 **Machine Learning Metareasoning** Michael T. Cox, Anita Raja, 2011 Experts report on the latest artificial intelligence research concerning reasoning about reasoning itself **Artificial Intelligence** D. Sleeman, N. O. Paul Benjamin, 2012-12-06 Change of Representation and Inductive Bias One of the most important emerging concerns of machine learning researchers is the dependence of their learning programs on the underlying representations especially on the languages used to describe hypotheses The effectiveness of learning algorithms is very sensitive to this choice of language choosing too large a language permits too many possible hypotheses for a program to consider precluding effective learning but choosing too small a language can prohibit a program from being able to find acceptable hypotheses This dependence is not just a pitfall however

it is also an opportunity The work of Saul Amarel over the past two decades has demonstrated the effectiveness of representational shift as a problem solving technique An increasing number of machine learning researchers are building programs that learn to alter their language to improve their effectiveness At the Fourth Machine Learning Workshop held in June 1987 at the University of California at Irvine it became clear that the both the machine learning community and the number of topics it addresses had grown so large that the representation issue could not be discussed in sufficient depth A number of attendees were particularly interested in the related topics of constructive induction problem reformulation representation selection and multiple levels of abstraction Rob Holte Larry Rendell and I decided to hold a workshop in 1988 to discuss these topics To keep this workshop small we decided that participation be by invitation only

A Compendium of Machine Learning: Symbolic machine learning Garry Briscoe, Terry Caelli, 1996 Machine learning is a relatively new branch of artificial intelligence The field has undergone a significant period of growth in the 1990s with many new areas of research and development being explored

Goal-driven Learning Ashwin Ram, David B. Leake, 1995 Brings together a diversity of research on goal driven learning to establish a broad interdisciplinary framework that describes the goal driven learning process In cognitive science artificial intelligence psychology and education a growing body of research supports the view that the learning process is strongly influenced by the learner's goals The fundamental tenet of goal driven learning is that learning is largely an active and strategic process in which the learner human or machine attempts to identify and satisfy its information needs in the context of its tasks and goals its prior knowledge its capabilities and environmental opportunities for learning This book brings together a diversity of research on goal driven learning to establish a broad interdisciplinary framework that describes the goal driven learning process It collects and solidifies existing results on this important issue in machine and human learning and presents a theoretical framework for future investigations The book opens with an overview of goal driven learning research and computational and cognitive models of the goal driven learning process This introduction is followed by a collection of fourteen recent research articles addressing fundamental issues of the field including psychological and functional arguments for modeling learning as a deliberative planful process experimental evaluation of the benefits of utility based analysis to guide decisions about what to learn case studies of computational models in which learning is driven by reasoning about learning goals psychological evidence for human goal driven learning and the ramifications of goal driven learning in educational contexts The second part of the book presents six position papers reflecting ongoing research and current issues in goal driven learning Issues discussed include methods for pursuing psychological studies of goal driven learning frameworks for the design of active and multistrategy learning systems and methods for selecting and balancing the goals that drive learning

A Bradford Book Machine Learning - EWSL-91 Yves Kodratoff, 1991-02-20 In this book contemporary knowledge of superconductivity is set against its historical background First the highlights of superconductivity research in the twentieth century are reviewed Further contributions then describe the

basic phenomena resulting from the macroscopic quantum state of superconductivity such as zero resistivity the Meissner Ochsensfeld effect and flux quantization and review possible mechanisms including the classical BCS theory and the more recent alternative theories The main categories of superconductors elements intermetallic phases chalcogenides oxides and organic compounds are described Common features and differences in their structure and electronic properties are pointed out This broad overview of superconductivity is completed by a discussion of properties related to the coherence length Newcomers to the field who seek an overall picture of research in superconductivity and of the cross links between its branches will find this volume especially useful

Machine Learning and Its Applications Georgios Paliouras, Vangelis Karkaletsis, Constantine D. Spyropoulos, 2003-06-29 In recent years machine learning has made its way from artificial intelligence into areas of administration commerce and industry Data mining is perhaps the most widely known demonstration of this migration complemented by less publicized applications of machine learning like adaptive systems in industry financial prediction medical diagnosis and the construction of user profiles for Web browsers This book presents the capabilities of machine learning methods and ideas on how these methods could be used to solve real world problems The first ten chapters assess the current state of the art of machine learning from symbolic concept learning and conceptual clustering to case based reasoning neural networks and genetic algorithms The second part introduces the reader to innovative applications of ML techniques in fields such as data mining knowledge discovery human language technology user modeling data analysis discovery science agent technology finance etc

The Impact of Emerging Technologies on Computer Science and Operations Research Stephen G. Nash, Ariela Sofer, 2012-12-06 The emergence of high performance computers and sophisticated software technology has led to significant advances in the development and application of operations research In turn the growing complexity of operations research models has posed an increasing challenge to computational methodology and computer technology This volume focuses on recent advances in the fields of Computer Science and Operations Research on the impact of technological innovation on these disciplines and on the close interaction between them The papers cover many relevant topics computational probability design and analysis of algorithms graphics heuristic search and learning knowledge based systems large scale optimization logic modeling and computation modeling languages parallel computation simulation and telecommunications 1 This volume developed out of a conference held in Williamsburg Virginia January 5-7 1994 It was sponsored by the Computer Science Technical Section of the Operations Research Society of America The conference was attended by over 120 people from across the United States and from many other countries We would like to take this opportunity to thank the participants of the conference the authors the anonymous referees and the publisher for helping produce this volume We express our special thanks to Bill Stewart and Ed Wasil for serving as Area Editors
