Rainbowfishes of Australia and Papua New Guinea Gerald R. Allen, Norbert J. Cross, 1982 Rainbowfishes of Australia and Papua New Guinea Gerald R. Allen, Norbert J. Cross, 1982 Maps line drawings color photographs and text describe eight genera of rainbowfishes including fishes for the aquarium **1994 IUCN Red List of Threatened Animals** World Conservation Monitoring Centre, 1993 Lijst van soorten die bedreigd worden met uitsterven en soorten die zeer schaars voorkomen in het wild Limnology in Australia P. de Deckker, W.D. Williams, 2012-12-06 Australia is the world's driest inhabited continent Water is our limiting resource It might therefore be thought that our water resources would be the subject of the most intensive study Certain aspects it must be conceded have received much attention notably the availability of water in terms of actual quantity The size of the surface water and the groundwater resource is well understood and indeed receives about as much study as can reasonably be expected in a country with as sparse a population and level of scientific manpower as ours Although the importance of understanding the water resource in terms of quantity is widely accepted what has not been generally appreciated is that for this resource to be available to human society for all the different uses to which it is put it is not sufficient that there exists within easy reach of the end users a certain total volume of water For that water to fulfil its functions for agriculture industry the home recreation biological conservation it must be in a certain state it must conform to certain chemical physical and biological criteria and what has not been sufficiently appreciated in Australian society is that the condition a water is in depends very much on the ecology of the waterbody in which it resides There are waterbodies in the world for example high altitude glacial lakes which are naturally so pristine that their water could be used for any purpose without treatment *Freshwater Fish Distribution* Tim M. Berra, 2008-09-15 With more than 29 000 species fishes are the most diverse group of vertebrates on the planet Of that number more than 12 000 species are found in freshwater ecosystems which occupy less than 1 percent of the Earth's surface and contain only 2.4 percent of plant and animal species But on a hectare for hectare basis freshwater ecosystems are richer in species than more extensive terrestrial and marine habitats Examination of the distribution patterns of fishes in these fresh waters reveals much about continental movements and climate changes and has long been critical to biogeographical studies and research in ecology and evolution Tim Berra's seminal resource *Freshwater Fish Distribution* maps the 169 fish families that swim in fresh water around the world Each family account includes the class subclass and order a pronunciation guide to the family name life cycle information and interesting natural history facts Each account is illustrated many with historical nineteenth century woodcuts Now available in paperback this heavily cited work in ichthyology and biogeography will serve as a reference for students a research support for professors and a helpful guide to tropical fish hobbyists and anglers
