Sex-Based Differences in Lung Physiology Patricia Silveyra, Xenia T. Tigno, 2021-03-18

This book provides an overview of the latest experimental work on sex-based differences in lung function and inflammation. Readers will learn how these differences relate to individual predispositions for the development of lung disease in men and women and in different stages of their reproductive lives. Further, the book focuses on diseases that predominantly affect women or men with an emphasis on the physiological mechanisms underlying their pathobiology. In turn, these findings are complemented by chapters on recent studies which investigate how circulating sex hormone levels impact the lung's innate immune response to environmental agents and air pollution. The pathogenesis of asthma and viral respiratory infection are also major focus areas. As an outlook, the book also discusses current and future research directions aimed at developing sex-specific therapies for lung disease. To examine these anatomical and physiological differences in the male and female respiratory systems, the authors employ a broad range of methods from molecular and clinical biology. Accordingly, the book will be a fascinating read for physiologists and clinicians.

differences are not negligible and sex difference research cannot be discriminating against one sex or the other. In fact, a better understanding of the underlying causes of sex differences has great advantages for both men and women and society as a whole, not only in terms of health care but in every aspect of life. Gender equality can only work out if it is equally well understood for men and women what their individual resources and needs are. Therefore, it is of great importance to pave the way for identifying the underlying principles of structural and functional brain organization that cause men and women to act, think, and feel differently. To this end, it is of particular interest to identify possible similarities and interrelations between sex differences that did so far stand separately in order to investigate whether they share a common source. To understand where a specific sex difference comes from and whether or not it is caused by the same principle as other sex differences, it is necessary to explicitly link sex differences in behavior to their neuronal correlates and vice versa, link sex differences in brain structure and function to their behavioral outcomes. In particular, a new understanding of male and female brain functioning may arise from findings on how sex hormones interact with various neurotransmitter systems. In the past few years, several findings demonstrated that women's behavior is influenced by the sex hormone fluctuations they experience naturally during their menstrual cycle to the extent that sex differences may only be detectable in one cycle phase but not another. The study of menstrual cycle-dependent effects gives important hints about which sex differences are activational and which are organizational. Additionally, it only recently came to attention that hormonal contraception may alter a woman's mood, cognition, and behavior as a consequence of changes in brain structure and function. The underlying mechanisms are so poorly understood that it is even hard to predict whether hormonal contraception will mask or amplify sex differences in a given task. Since the oral hormonal contraceptive pill is meanwhile used by 100 million women worldwide and even by teenagers whose brains are not yet fully developed, the question of how the synthetic steroids contained in hormonal contraceptives act on the brain is to be studied hand in hand with naturally occurring sex differences. This topic summarizes the current state of the art in sex difference research and gives new perspectives in terms of hypothesis generation and methodology. Both are necessary to gain a complete picture of what it is that makes a brain male or female and move towards a neuroscience of sex differences.
