Barriers and Accident Prevention Erik Hollnagel, 2016-12-05. Accidents are preventable but only if they are correctly described and understood. Since the mid 1980s accidents have come to be seen as the consequence of complex interactions rather than simple threads of causes and effects. Yet progress in accident models has not been matched by advances in methods. The author's work in several fields: aviation, power production, traffic safety, healthcare, made it clear that there is a practical need for constructive methods and this book presents the experiences and the state of the art. The focus of the book is on accident prevention rather than accident analysis and unlike other books has a proactive rather than reactive approach. The emphasis on design rather than analysis is a trend also found in other fields. Features of the book include: A classification of barrier functions and barrier systems that will enable the reader to appreciate the diversity of barriers and to make informed decisions for system changes. A perspective on how the understanding of accidents, the accident model, largely determines how the analysis is done and what can be achieved. The book critically assesses three types of accident models: sequential, epidemiological, systemic, and compares their strengths and weaknesses. A specific accident model that captures the full complexity of systemic accidents. One consequence is that accidents can be prevented through a combination of performance monitoring and barrier functions rather than through the elimination or encapsulation of causes. A clearly described methodology for barrier analysis and accident prevention. Written in an accessible style. *Barriers and Accident Prevention* is designed to provide a stimulating and practical guide for industry professionals familiar with the general ideas of accidents and human error. The book is directed at those involved with accident analysis and system safety such as managers of safety departments, risk and safety consultants, human factors professionals, and accident investigators. It is applicable to all major application areas such as aviation, ground transportation, maritime, process industries, healthcare, and hospitals, communication systems, and service providers.

Technology and Assessment of Safety-Critical Systems Felix Redmill, Tom Anderson, 2012-12-06 The programme for the Second Safety critical Systems Symposium was planned to examine the various aspects of technology currently employed in the design of safety critical systems as well as to emphasise the importance of safety and risk management in their design and operation assessment There is an even balance of contributions from academia and industry Thus industry is given the opportunity to express its views of the safety critical domain and at the same time offered a glimpse of the technologies which are currently under development and which if successful will be available in the medium term future In the field of technology a subject whose importance is increasingly being recognised is human factors and there are papers on this from the University of Hertfordshire and Rolls Royce Increasingly PLCs are being employed in safety critical applications and this domain is represented by contributions from Nuclear Electric and August Computers Then there are papers on maintainability Ada reverse engineering social issues formal methods and medical systems all in the context of safety And of course it is not possible to keep the new technologies out of the safety critical domain there are papers on neural networks from the University of Exeter and knowledge based systems from ERA Technology

Risk Engineering A.V. Gheorghe, Ralf Mock, 2012-12-06 Industrial development is essential to improvement of the standard of living in all countries People's health and the environment can be affected directly or indirectly by routine waste discharges or by accidents A series of recent major industrial accidents and the effect of pollution highlighted once again the need for better management of routine and accidental risks Moreover the existence of natural hazards complicate even more the situation in any given region In the past effort to cope with these risks if made at all have been largely on a plant by plant basis some plants are well equipped to manage environmental and health hazards while others are not Managing the hazards of modern technological systems has become a key activity in highly industrialised countries Decision makers are often confronted with complex issues concerning economic and social development industrialisation and associated infrastructure needs population and land use planning Such issues have to be addressed in such a way that ensures that public health will not be disrupted or substantially degraded Due to the increasing complexity of technological systems and the higher geographical density of punctual hazard sources new methodologies and a novel approach to these problems are challenging risk managers and regional planners Risks from these new complex technological systems are inherently different from those addressed by the risk managers for decades ago
