Risk Factors And Contagion In Commodity Markets And Stocks Markets

Stephane Goutte,Khaled Guesmi,2020-04-28 The link between commodities prices and the business cycle including variables such as real GDP industrial production unemployment inflation and market uncertainty has often been debated in the macroeconomic literature To quantify the impact of commodities on the economy one can distinguish different modeling approaches First commodities can be represented as the pinnacle of cross sectional financial asset prices Second price fluctuations due to seasonal variations dramatic market changes political and regulatory decisions or technological shocks may adversely impact producers who use commodities as input This latter effect creates the so called commodities risk Additionally commodities price fluctuations may spread to other sectors in the economy via contagion effects Besides stronger investor interest in commodities may create closer integration with conventional asset markets as a result the financialization process also enhances the correlation between commodity markets and financial markets Our objective in this book Risk Factors and Contagion in Commodity Markets and Stocks Markets lies in answering the following research questions What are the interactions between commodities and stock market sentiment Do some of these markets move together overtime Did the financialization in energy commodities occur after the 2008 Global Financial Crisis These questions are essential to understand whether commodities are driven only by their fundamentals or whether there is also a systemic component influenced by the volatility present within the stock markets

Assessment QT Interval Prolongation and Beyond

Into the Heart of Systemic Autoimmune Diseases Franco Franceschini,Antonio

Brucato,Micaela Fredi,Silvia Piantoni,2024-03-27 Systemic autoimmune diseases are a heterogeneous group of disorders characterized by humoral and cell mediated immune responses against various self constituents In specific cases the heart and cardiovascular CV system are the primary organs targeted by the disease On the other hand several systemic autoimmune conditions are linked to enhanced atherosclerosis with a consequently high CV morbidity and mortality rates Persistent low grade inflammation in the vascular wall is described to be important in the physiopathology of CV events At first inflammation is linked to endothelial dysfunction supporting the proliferation of vascular smooth muscle cells with

subsequent vascular remodeling Furthermore the infiltration of innate and adaptive immune cells promotes a milieu of molecules that contributes to the perpetuation of inflammation itself Although CV risk assessment should be part of routine care in patients with autoimmune diseases no disease specific models are currently available for this purpose The main pillars of CV risk reduction are pharmacological and nonpharmacological management of cardiovascular CV risk factors as well as tight control of disease activity
