Risk And Return In Transportation And Other US And Global Industries:

Risk and Return in Transportation and Other US and Global Industries Manolis G. Kavussanos, Stelios Marcoulis, 2013-03-09 The type of research methodologies used in analysing stock returns in the book is outlined in this technical chapter The chapter begins with definitions of useful summary statistics such as the mean standard deviation coefficient of variation and their interpretation Tests statistics for inferences on population means proportions and differences of means among others are also presented A summary of single equation regression techniques and the way these are applied through estimation and inference are outlined focusing on the interpretation of standard output and diagnostic tests The single equation methodology is then extended to multiple equation systems the methods of Multivariate Least Square MLSQ of Seemingly Unrelated Regression Equations SURE are Regressions as well as those considered Time series ARIMA models form also part of the discussion This is a chapter which is aimed at readers who are interested in understanding the technical background used in deriving results later in the book

2.2 Summary Statistics for a set of Data A set of numbers which are generated by agents actions in the market and which can take different values if the agents were to repeat their actions are known as random variables For example prices of shares in the stock exchange are determined at each point in time from the collective actions of agents operating in the market through their demand and supply decisions The price of a share is thus a random variable and so is the return of the share

Risk and Return in Transportation and Other US and Global Industries Manolis G. Kavussanos, Stelios Marcoulis, Stelios N. Marcoulis, 2001-06-30 This book undertakes industry analysis of the risk return behaviour of stock returns in the US It focuses on transportation and a number of non transportation companies with particular attention paid to water transportation The market risk measured by beta is identified as the relevant metric to use for comparison Single and multi index models are employed to identify exposures betas to market microeconomic and macroeconomic types of risk in each industry These industries include water transportation air transportation trucks rail transportation electricity gas petroleum refining and real estate Microeconomic factors employed include market value of equity book to market value of equity ratio earnings to price ratio asset to market value of equity ratio and asset to book value of equity ratio Macroeconomic factors include industrial production term structure of interest rates oil prices consumption and inflation Returns of each industry seem to be explained by different sets of economic factors For shipping apart from the market industrial production oil prices the market value of equity and the asset to book ratio are significant Moreover the systematic risk of this industry is not different to that of the market has not changed significantly under different market conditions is lower than rail transportation higher than real estate and similar to that of the remaining industries The analysis is also extended beyond the US to global industry portfolios

International Maritime Transport Heather Leggate, James McConville, Alfonso Morvillo, 2004-08-02 The importance of the international maritime transport industry is difficult to overstate This new book presents an interdisciplinary approach from a

wide range of internationally based experts International Maritime Transport represents a radical departure from previous works in its structure and approach The section editors each discuss the state of the art in the opening chapter before introducing a selection of works providing a wide ranging analysis of the subject Wide discretion of approach has provided literary freedom for individual opinion and analysis within the overall framework this permits a level of innovation which is perhaps stifled by the more standardized model Whilst each perspective can be seen as exclusive together they form a comprehensive volume of issues in contemporary maritime transport Topics covered include ports as interfaces logistics manpower and skills financial risk and opportunities the regulatory framework Each chapter contains an introduction which explains the context of the chapter within the book and the contemporary state of the art Under the editorship of maritime experts James McConville Alfonso Morvillo and Heather Leggate the book is sure to be of interest to students and academics working on maritime studies as well as being useful to professionals and policy makers in the maritime industry

International Bibliography of Book Reviews of Scholarly Literature Chiefly in the Fields of Arts and Humanities and the Social Sciences ,2002 *Estimating beta and Cost of Equity Capital for Non-traded Transportation Companies* Sascha Heller,2014-04-11 Inhaltsangabe Introduction Estimating the cost of equity capital has two major implications First it reflects the return to a company s stock which an equity investor expects to receive from his investment He makes his decision upon whether he could earn a higher rate of return in an alternative investment of equivalent risk Second a company must earn the cost of capital both debt and equity through its undertaken projects It is hence relevant for decisions on undertaking positive net present value projects which are of similar risk as the company s average business activities It also substantially influences the pricing of an entire firm as far as the valuation is based on a discounted cash flow model A lot of effort has been done in the past to achieve accurate models which precisely determine this cost Building on the modern portfolio theory of Harry Markowitz a widely used and commonly known model in this context is the Capital Asset Pricing Model CAPM Introduced by several researchers in the 1960s it is still one of the most applied methods for practitioners However it suffers from several shortcomings including statistical caveats economic assumptions the absence of market frictions and the behaviour of market participants An upgrade to this model was provided by Stephen Ross which has resulted in the Arbitrage Pricing Theory APT It combines several risk factors in addition to one market proxy as it is the case in the CAPM and is less restrictive in its assumptions But both CAPM and APT require observable market data i e stock prices of the analysed companies These models thus only work for publicly listed firms If research should be done on non traded companies however an alternative methodology must be applied In general data from the balance sheet the income statement and the cash flow statement are available for both listed and non listed companies While accounting data have widely been used in the past as well and have been assumed to provide valuable information in explaining stock returns this line of research has dissipated over time Only a few key figures such as size and financial leverage are still considered to be relevant However they can be used to indirectly estimate a firm s beta by

assessing their explanatory power in a CAPM or APT framework This methodology is particularly beneficial for firms which are not listed because there cannot be observed any stock price movements **Global Competitiveness of U.S.**
