Lords Of The Fly Drosophila Genetics And The Experimental Life:

Lords of the Fly Robert E. Kohler, 1994-05-02 One of the most productive of all laboratory animals *Drosophila* has been a key tool in genetics research for nearly a century At the center of *Drosophila* culture from 1910 to 1940 was the school of Thomas Hunt Morgan and his students Alfred Sturtevant and Calvin Bridges who by inbreeding fruit flies created a model laboratory creature the standard fly By examining the material culture and working customs of Morgan's research group the author brings to light essential features of the practice of experimental science This book takes a broad view of experimental work ranging from how the fly was introduced into the laboratory and how it was physically redesigned for use in genetic mapping to how the Drosophilists organized an international network for exchanging fly stocks that spread their practices around the world Back cover

Lords of the Fly Robert E. Kohler, 1994-05-02 The common fruit fly *Drosophila* has long been one of the most productive of all laboratory animals From 1910 to 1940 the center of *Drosophila* culture in America was the school of Thomas Hunt Morgan and his students Alfred Sturtevant and Calvin Bridges They first created standard flies through inbreeding and by organizing a network for exchanging stocks of flies that spread their practices around the world In *Lords of the Fly* Robert E Kohler argues that fly laboratories are a special kind of ecological niche in which the wild fruit fly is transformed into an artificial animal with a distinctive natural history He shows that the fly was essentially a laboratory tool whose startling productivity opened many new lines of genetic research Kohler also explores the moral economy of the Drosophilists the rules for regulating access to research tools allocating credit for achievements and transferring authority from one generation of scientists to the next By closely examining the Drosophilists culture and customs Kohler reveals essential features of how experimental scientists do their work

Embryogenesis Explained Natalie K Gordon, Richard Gordon, 2016-09-15 The greatest mystery of life is how a single fertilized egg develops into a fully functioning sometimes conscious multicellular organism *Embryogenesis Explained* offers a new theory of how embryos build themselves and combines simple physics with the most recent biochemical and genetic breakthroughs based on the authors prediction and then discovery of differentiation waves They explain their ideas in a form accessible to the lay person and a broad spectrum of scientists and engineers The diverse subjects of development genetics and evolution and their physics are brought together to explain this major previously unanswered scientific question of our time As a follow up on *The Hierarchical Genome* this book is a shorter but conceptually expanded work for the reader who is interested in science It is useful as a starting point for the curious layman or the scientist or professional encountering the problem of embryogenesis without the formal biology background There is also material useful for the seasoned biologist caught up in the new rush of information about the role of mechanics in developmental biology and cellular level mechanics in medicine

A Short History of Medicine Erwin H. Ackerknecht, 2016-05-01 A bestselling history of medicine enriched with a new foreword concluding essay and bibliographic essay Erwin H Ackerknecht's *A Short History of Medicine* is a concise narrative long appreciated by

students in the history of medicine medical students historians and medical professionals as well as all those seeking to understand the history of medicine Covering the broad sweep of discoveries from parasitic worms to bacilli and x rays and highlighting physicians and scientists from Hippocrates and Galen to Pasteur Koch and Roentgen Ackerknecht narrates Western and Eastern civilization s work at identifying and curing disease He follows these discoveries from the library to the bedside hospital and laboratory illuminating how basic biological sciences interacted with clinical practice over time But his story is more than one of laudable scientific and therapeutic achievement Ackerknecht also points toward the social ecological economic and political conditions that shape the incidence of disease Improvements in health Ackerknecht argues depend on more than laboratory knowledge they also require that we improve the lives of ordinary men and women by altering social conditions such as poverty and hunger This revised and expanded edition includes a new foreword and concluding biographical essay by Charles E Rosenberg Ackerknecht s former student and a distinguished historian of medicine A new bibliographic essay by Lisa Haushofer explores recent scholarship in the history of medicine

Genetics and Reductionism Sahotra Sarkar,1998-10-13 With the advent of the Human Genome Project there have been many claims for the genetic origins of complex human behavior including insanity criminality and intelligence But what does it really mean to call something genetic This is the fundamental question that Sahotra Sarkar s book addresses The author analyses the nature of reductionism in classical and molecular genetics He shows that there are two radically different kinds of reductionist explanation genetic reduction as found in classical genetics and physical reduction found in molecular genetics This important book clarifies the meaning of the term genetic shows how molecular studies have affected genetics and provides the philosophical background necessary to understand the debates over the Human Genome Project It will be of particular interest to professionals and students in the philosophy of science the history of science and the social studies of science medicine and technology

The Science of Human Perfection Nathaniel Comfort,2012-09-25 A thoughtful new look at the entwined histories of genetic medicine and eugenics with probing discussion of the moral risks of seeking human perfection

Landscapes and Labscapes Robert E. Kohler,2010-11-15 What is it like to do field biology in a world that exalts experiments and laboratories How have field biologists assimilated laboratory values and practices and crafted an exact quantitative science without losing their naturalist souls In *Landscapes and Labscapes* Robert E Kohler explores the people places and practices of field biology in the United States from the 1890s to the 1950s He takes readers into the fields and forests where field biologists learned to count and measure nature and to read the imperfect records of nature s experiments He shows how field researchers use nature s particularities to develop practices of place that achieve in nature what laboratory researchers can only do with simplified experiments Using historical frontiers as models Kohler shows how biologists created vigorous new border sciences of ecology and evolutionary biology

Classical Genetic Research and Its Legacy Jean-Paul Gaudillière,Hans-Jörg Rheinberger,2004-10-07 With the rise of genomics the life sciences have entered

a new era This book provides a comprehensive history of mapping procedures as they were developed in classical genetics An accompanying volume From Molecular Genetics to Genomics covers the history of molecular genetics and genomics The book shows that the technology of genetic mapping is by no means a recent acquisition of molecular genetics or even genetic engineering It demonstrates that the development of mapping technologies has accompanied the rise of modern genetics from its very beginnings In Section One Mendelian genetics is set in perspective from the viewpoint of the detection and description of linkage phenomena Section Two addresses the role of mapping for the experimental working practice of classical geneticists their social interactions and for the laboratory life worlds With detailed analyses of the scientific practices of mapping and its illustration of the diversity of mapping practices this book is a significant contribution to the history of genetics A companion volume from the same editors From Molecular Genetics to Genomics The Mapping Cultures of Twentieth Century Genetics covers the history of molecular genetics and genomics *Model Behavior* Nicole C.

Nelson,2018-04-04 Mice are used as model organisms across a wide range of fields in science today but it is far from obvious how studying a mouse in a maze can help us understand human problems like alcoholism or anxiety How do scientists convince funders fellow scientists the general public and even themselves that animal experiments are a good way of producing knowledge about the genetics of human behavior In *Model Behavior* Nicole C Nelson takes us inside an animal behavior genetics laboratory to examine how scientists create and manage the foundational knowledge of their field Behavior genetics is a particularly challenging field for making a clear cut case that mouse experiments work because researchers believe that both the phenomena they are studying and the animal models they are using are complex These assumptions of complexity change the nature of what laboratory work produces Whereas historical and ethnographic studies traditionally portray the laboratory as a place where scientists control simplify and stabilize nature in the service of producing durable facts the laboratory that emerges from Nelson s extensive interviews and fieldwork is a place where stable findings are always just out of reach The ongoing work of managing precarious experimental systems means that researchers learn as much if not more about the impact of the environment on behavior as they do about genetics *Model Behavior* offers a compelling portrait of life in a twenty first century laboratory where partial provisional answers to complex scientific questions are increasingly the norm **A Guinea Pig's History of Biology** Jim Endersby,2007 Biology today promises

everything from better foods or cures For common diseases to the alarming prospect of redesigning life itself Looking at the organisms that have made all this possible gives us a new way of understanding how we got here and perhaps of thinking about where we re going Instead of a history of which great scientists had which great ideas this story of passionflowers and hawkweeds of zebra fish and viruses oilers a bird s or rodent s eye view of the work that makes science possible Book Jacket

Deep Homology? Lewis I. Held, Jr,2017-01-28 Humans and flies look nothing alike yet their genetic circuits are remarkably similar Here Lewis I Held Jr compares the genetics and development of the two to review the evidence for deep

homology the biggest discovery from the emerging field of evolutionary developmental biology Remnants of the operating system of our hypothetical common ancestor 600 million years ago are compared in chapters arranged by region of the body from the nervous system limbs and heart to vision hearing and smell Concept maps provide a clear understanding of the complex subjects addressed while encyclopaedic tables offer comprehensive inventories of genetic information Written in an engaging style with a reference section listing thousands of relevant publications this is a vital resource for scientific researchers and graduate and undergraduate students

Genetic Medicine Barton Childs, 2003-09-15 In *Genetic Medicine A Logic of Disease* Barton Childs demonstrates that knowledge of the ways both genes and environment contribute to disease provides a rational basis for medical thinking This genetic medicine he explains should help the physician use the results of laboratory tests to perceive the uniqueness of the patient as well as that of the family and the cultural conditions in which the patient's condition arose Childs thus provides a conceptual framework within which to teach and practice a humane medicine

The Recombinant University Doogab Yi, 2015-03-23 The advent of recombinant DNA technology in the 1970s was a key moment in the history of both biotechnology and the commercialization of academic research Doogab Yi's *The Recombinant University* draws us deeply into the academic community in the San Francisco Bay Area where the technology was developed and adopted as the first major commercial technology for genetic engineering In doing so it reveals how research patronage market forces and legal developments from the late 1960s through the early 1980s influenced the evolution of the technology and reshaped the moral and scientific life of biomedical researchers Bay Area scientists university administrators and government officials were fascinated by and increasingly engaged in the economic and political opportunities associated with the privatization of

academic research Yi uncovers how the attempts made by Stanford scientists and administrators to demonstrate the relevance of academic research were increasingly mediated by capitalistic conceptions of knowledge medical innovation and the public interest Their interventions resulted in legal shifts and moral realignments that encouraged the privatization of academic research for public benefit The Recombinant University brings to life the hybrid origin story of biotechnology and the ways the academic culture of science has changed in tandem with the early commercialization of recombinant DNA technology

Moments of Truth in Genetic Medicine M. Susan Lindee, 2008-11-24 Genetic research increasingly dominates medical thought and practice in the United States and in many other industrialized nations Susan Lindee's original study explores the institutions disciplines and ideas that initiated the reconfiguration of genetic medicine from a marginal field in the mid 1950s to a core research frontier of biomedicine Tracing the work of geneticists and other experts in identifying and classifying disease during the explosive period between 1950 and 1980 Lindee identifies the individual moments of truth that moved the field away from its eugenic past to the center of a new world view in which nearly all disease is understood to be fundamentally genetic She suggests that these moments of truth were experienced not only by scientists but also by those who had familial intimate emotional knowledge of hereditary disease patients family members and research subjects Focusing on benchmarks in the field such as the rise of neonatal testing in the 1960s genetic studies of unique human populations such as the Amish the development of human cytogenetics and human behavioral genetics and the efforts to find genes for rare diseases such as familial dysautonomia she tracks the emergence of a biomedical consensus that nearly all disease is genetic disease Using the success of this field as a point of

entry Lindee chronicles both the production of knowledge in biomedicine and changes in the cultural meaning of the body in the late twentieth century She suggests that scientific knowledge is a community project that is shaped directly by people in many different social and professional locations The power to experience and report scientific truth may be much more dispersed than it sometimes appears because people know things about their own bodies and their knowledge has often been incorporated into the technical infrastructure of genomic medicine Lindee's pathbreaking study shows the interdependence of technical and social parameters in contemporary biomedicine *Biotechnology and Society* Hallam Stevens, 2016-10-06

With *Biotechnology and Society* Hallam Stevens offers an up to date primer to help us understand the interactions of biotechnology and society and the debates controversies fears and hopes that have shaped how we think about bodies organisms and life in the twenty first century Stevens addresses such topics as genetically modified foods cloning and stem cells genetic testing and the potential for discrimination fears of and in some cases hopes for designer babies personal genomics biosecurity and biotech art Taken as a whole the book presents a clear authoritative picture of the relationship between biotechnology and society today and how our conceptions and misconceptions of it could shape future developments It is an essential volume for students and scholars working with biotechnology while still being accessible to the general reader interested in the truth behind breathless media accounts about biotech's promise and perils *Animal Places* Jacob Bull, Tora Holmberg, Cecilia Åsberg, 2017-11-22

Nonhuman animals are ubiquitous to our human societies Interdisciplinary human animal research has for 50 years drawn attention to how animals are ever present in what we think of as human spaces and cultures Our societies are built with animals and through all kinds of multispecies interactions From public spaces and laboratories to homes farms and in the wilderness human and nonhuman animals meet to make space and place together through webs of power relations However the very spaces of these interactions are not mute or passive themselves The spaces where species meet matter and shape human animal relations This book takes as its starting point the relationship between place and human animal interaction It brings together the work of leading scholars in human animal studies from a variety of disciplinary and interdisciplinary backgrounds With a distinct focus on place physical space and biocultural geography the authors of this volume consider the ways in which space human and nonhuman animals co constitute each other how they make spaces together produce meaning around them struggle over access how these places are storied and how stories of spaces matter Presenting studies thematically and including a variety of nonhuman creatures in a range of settings this book delivers new understandings of the importance of nonhuman animals to understandings of place and the role of places in shaping our interactions with nonhuman creatures As pets as laboratory animals as exhibits as parasites as livestock as quarry as victims of disaster or objects of folklore this book offers insights into human animal intermingling at locales and settings of great relevance to many areas of research including geography sociology science and technology studies gender studies history and anthropology This book meets the evolving interest in human animal

interaction anthrozoology and the environmental humanities in relation to the research on space and place that currently informs the humanities and the social sciences
