What is an interpretative phenomenological analysis case study?

Interpretative phenomenological analysis (IPA) is a widely recognised and well-established method of qualitative inquiry designed to explore personal experience in detail, focusing on participants' understandings and sense-making.¹ In this article, we explain what distinguishes an IPA case study from a typical IPA study and highlight the strengths and limitations of this approach. While IPA is frequently used with small samples, single-participant IPA case studies can offer unique insights into deeply personal or rare experiences.

An overview of IPA

IPA was developed in the mid-1990s by Jonathan Smith and emerged out of health psychology, and since the early 2000s has increasingly been adopted by nursing and health researchers more generally. At the time of writing, a Google Scholar search of the terms 'interpretative phenomenological analysis' and 'nursing' yielded more than 35 000 results. IPA is primarily interested in undertaking a detailed exploration of lived experience. Importantly, it posits that experience is something that can be investigated by examining the meaning and sense-making that people engage in as they reflect on it.² While IPA can be applied to a wide range of personal life experiences, it is most sensitive to those with major life significance.³ For example, to explore and understand the barriers to mental health nurses' ability to engage in self-care and its impact on themselves and their work.⁴ One of the reasons IPA has been adopted by health researchers is because it is particularly receptive to uncovering nuances below the surface that some other qualitative approaches are not necessarily sensitive to capturing. In the context of the subjective experiences of illness and disease, these details and insights can have real-world significance for understanding the embodied experience of living with a particular health condition. IPA is committed to three underlying theoretical principles—phenomenology, hermeneutics and idiography.⁵ Phenomenology describes a philosophical approach to studying and giving an account of conscious experience from the first-person perspective. In IPA, phenomenological inquiry is understood as being a hermeneutic or interpretive endeavour, which means that understanding human experience necessarily requires interpretation. Lastly, idiography refers to IPA's commitment to a case study level of detailed systematic analysis that entails focusing exclusively on the data from a single individual before moving on to the next.⁶

The commitment to idiographic detail is one of the distinct features of IPA studies, which is why they commonly involve comparatively smaller sample sizes compared with many other qualitative approaches. The reason for this is that when conducted properly, the level

of detail and time required to analyse the data (eg, a single transcript from a semistructured interview) will usually make larger sample sizes unfeasible without compromising the depth of analysis.

What is an IPA case study?

IPA's commitment to idiographic detail is narrowed down even further in an IPA case study because its focus relies wholly on data from a single case, and so one distinguishing feature is that the study will involve just a single participant. This approach offers opportunities alongside some disadvantages, but it can still be a valuable mode of qualitative inquiry for the health researcher. An IPA case study can offer a unique opportunity to explore a single case in all its richness and complexity, which may not be possible to the same extent with additional participants. Arguably, unique and novel experiences may sometimes warrant a level of attention that only a case study level of detail can provide. This level of attention can be useful for identifying areas for further study and for interrogating the underlying assumptions of social-cultural norms.

When to choose an IPA case study?

There are several reasons why a health researcher might choose to adopt an IPA case study approach. While this is not an exhaustive list, here are several examples where an IPA study could be indicated. First, in cases of incredibly rare diseases, disorders and illnesses, it may not be possible or pragmatic to access more than a single participant. In such instances, a single IPA case study of the phenomena could help to provide crucial insights into a particularly rare disease process where little is known about the experiences of those living with it. However, even within more common conditions, novel problems can emerge in a single individual, and an IPA case study can provide an opportunity to capture the essence of these personal experiences.⁷ Such an approach may offer insights that could help others with the same or similar condition. Second, in transformative life events that might have significant implications for one's identity; this could involve exploring the experience of someone undergoing a novel first-of-its-kind therapy. For example, a novel gene therapy that might have a transformative effect on an individual's health and sense of self. Third, it may be an appropriate choice when studying marginalised groups where it can be more challenging to recruit enough participants with the necessary shared experience. Consequently, an IPA case study can help amplify the voice of an individual from a marginalised group and provide insights into experiences that can be overlooked. Lastly, the most common indication for an IPA case study is as a stepping stone towards a larger IPA study. A single case can provide valuable insights into potential methodological obsta-
