Science and the American Century Sally Gregory Kohlstedt, David Kaiser, 2013-03-14 The twentieth century was one of astonishing change in science especially as pursued in the United States Against a backdrop of dramatic political and economic shifts brought by world wars intermittent depressions sporadic and occasionally massive increases in funding and expanding private patronage this scientific work fundamentally reshaped everyday life *Science and the American Century* offers some of the most significant contributions to the study of the history of science technology and medicine during the twentieth century all drawn from the pages of the journal *Isis* Fourteen essays from leading scholars are grouped into three sections each presented in roughly chronological order The first section charts several ways in which our knowledge of nature was cultivated revealing how scientific practitioners and the public alike grappled with definitions of the natural as they absorbed and refracted global information The essays in the second section investigate the changing attitudes and fortunes of scientists during and after World War II The final section documents the intricate ways that science as it advanced became intertwined with social policies and the law This important and useful book provides a thoughtful and detailed overview for scholars and students of American history and the history of science as well as for scientists and others who want to better understand modern science and science in America

importance of climate science the role of scientific racism the construction of gender and how science and disability studies converge The final chapter reviews the way in which society has embraced or rejected science with reflections on the recent pandemic and what it may mean for the future of American science This book fills a much needed gap in the history and historiography of American science studies and will be an invaluable guide for any student or researcher in the history of science in America

Designing the New American University Michael M. Crow, William B. Dabars, 2015-03-15 A radical blueprint for reinventing American higher education America's research universities consistently dominate global rankings but may be entrenched in a model that no longer accomplishes their purposes With their multiple roles of discovery teaching and public service these institutions represent the gold standard in American higher education but their evolution since the nineteenth century has been only incremental The need for a new and complementary model that offers broader accessibility to an academic platform underpinned by knowledge production is critical to our well being and economic competitiveness Michael M Crow president of Arizona State University and an outspoken advocate for reinventing the public research university conceived the New American University model when he moved from Columbia University to Arizona State in 2002 Following a comprehensive reconceptualization spanning more than a decade ASU has emerged as an international academic and research powerhouse that serves as the foundational prototype for the new model Crow has led the transformation of ASU into an egalitarian institution committed to academic excellence inclusiveness to a broad demographic and maximum societal impact In *Designing the New American University* Crow and coauthor William B Dabars a historian whose research focus is the American research university examine the emergence of this set of institutions and the imperative for the new model the tenets of which may be adapted by colleges and universities both public and private Through institutional innovation say Crow and Dabars universities are apt to realize unique and differentiated identities which maximize their potential to generate the ideas products and processes that impact quality of life standard of living and national economic competitiveness *Designing the New American University* will ignite a national discussion about the future evolution of the American research university

security restrictions These changes affected not just the arms race and the space race but also research in agriculture biomedicine computer science ecology meteorology and other fields This volume examines science and technology in the context of the Cold War considering whether the new institutions and institutional arrangements that emerged globally constrained technoscientific inquiry or offered greater opportunities for it The contributors find that whatever the particular science and whatever the political system in which that science was operating the knowledge that was produced bore some relation to the goals of the nation state These goals varied from nation to nation weapons research was emphasized in the United States and the Soviet Union for example but in France and China scientific independence and self reliance dominated The contributors also consider to what extent the changes to science and technology practices in this era were produced by the specific politics anxieties and aspirations of the Cold War Contributors Elena Aronova Erik M Conway Angela N H Creager David Kaiser John Krige Naomi Oreskes George Reisch Sigrid Schmalzer Sonja D Schmid Matthew Shindell Asif A Siddiqi Zuoyue Wang Benjamin Wilson
