Perspectives on Poisons

Natural and Synthetic Neurotoxins. A. L. HARVEY, Ed. Academic Press, San Diego, CA, 1993. xviii, 359 pp., illus. \$45 or £45. Neuroscience Perspectives.

It has been more than a century since Claude Bernard, in his *Experimental Science*, provided a definition of poisons in modern terms and indicated their special usefulness for the physiologist. Bernard suggested that by dissecting the mechanisms that result in death we could learn much about the physiological processes of life. The 19th-century reader of Bernard's book could not have imagined the impact this suggestion would have, the extent of the information that would accumulate, or the number of books and articles on the subject that would appear. *Natural and Synthetic Neurotoxins* is the latest such endeavor. Its individual contributions review the fundamental chemistry and pharmacology of neurotoxins, describe their main interactions with their target structures, and indicate their many interesting uses as experimental tools.

The book centers around a well-written and pedagogically valuable chapter on neurotoxins that act on acetylcholine receptors. Here Chiappinelli gradually reveals the problems, offering an optimistic yet realistic outlook on future research. The chapter contains a history of work on this topic, rich in learned citations, as well as a systematic analysis of the structure and mode of action of the toxins known to be active on nicotinic and muscarinic acetylcholine receptors. Equally effective is Simpson's chapter on the action of clostridial neurotoxins on the storage and release of neurotransmitters, although an explosion of new data on the putative mode of action of these toxins has undermined some of the ideas in it. I also enjoyed Lobban and Milligan's chapter on the structure and function of bacterial exotoxins (essentially cholera and pertussis toxins) and their action on the second intracellular messenger pathway. Irwin and Langston review the toxicology of 1-methyl-4-phenyl-1,2,3,6-tetrahydropyridine (MPTP), which induces a parkinsonian syndrome in humans that is

very useful for developing animal models of that disease. Equally stimulating are the chapters on the neurotoxins that allow a mapping of neuronal pathways by lesioning that both elucidates the toxins' physiological and behavioral effects and facilitates the establishment in animal models of syndromes that mimic human diseases. Vornov et al. have contributed a well-documented chapter describing the neurotoxicity of excitatory neurotransmitters.

The authors of the rest of the chapters tend to present their data by way of an iterative formula: "toxin-toxin structure-target structure-putative organization of the target." Although informative, these contributions are too schematic to really engage the reader. A more serious criticism I have of the book is that some chapters seem to contain categorical statements about matters that are still under investigation (for instance, in the coverage of the effects of cannabinoids, social and behavioral aspects are ignored).

Overall I found this book a balanced compendium but rather inharmonious in style and awkward in structure. Problems of this sort can be forgiven in a book of such wide scope. Less acceptable are the numerous small errors scattered about (for example, "internationalization" for "internalization," "aspecific" for "a specific"), which could have been prevented by more careful proofreading.
