This book presents not only the simultaneous combination of optical methods based on holographic principles for marker free imaging real time trapping identification and tracking of micro objects but also the application of substantial low coherent light sources and non diffractive beams It first provides an overview of digital holographic microscopy DHM and holographic optical tweezers as well as non diffracting beam types for minimal invasive real time and marker free imaging as well as manipulation of micro and nano objects It then investigates the design concepts for the optical layout of holographic optical tweezers HOTs and their optimization using optical simulations and experimental methods In a further part the book characterizes the corresponding system modules that allow the addition of HOTs to commercial microscopes with regard to stability and diffraction efficiency Further based on experiments and microfluidic applications it demonstrates the functionality of the combined setup and discusses several types of non diffracting beams and their application in optical manipulation The book shows that holographic optical tweezers including several non diffracting beam types like Mathieu beams combined parabolic and Airy beams not only open up the possibility of generating efficient multiple dynamic traps for micro and nano particles with forces in the pico and nano newton range but also the opportunity to exert optical torque with special beams like Bessel beams which can facilitate the movement and rotation of particles by generating microfluidic flows The last part discusses the potential use of a slightly modified DHM HOT system to explore the functionality of direct laser writing based on a two photon absorption process in a negative photoresist with a continuous wave laser Digital

Resolution Improvement Methods Applied to Digital Holography Daniel Claus, 2010 This thesis discusses the creation acquisition and processing of digital holograms Several techniques to improve the optical resolution have been investigated and developed The optical resolution of numerically reconstructed digital holograms is restricted by both the sampling frequency and the overall sensor size of the digital camera chip used This thesis explores the limitations on the optical resolution of the holograms obtained A typical sensor size and sampling frequency for digital holograms is 10 mm and 100 lp/mm respectively whereas holographic plates used for optical holography can be more than a meter in size and have a sampling frequency of 3000 lp/mm In order to take full advantage of the benefits digital holography offers such as fast image acquisition and direct phase accessibility the problem of reduced resolution needs to be overcome Three resolution improvement methods have been developed in the scope of this PhD thesis Prior to implementing the resolution improvement methods different holographic setups have been analyzed using the Space bandwidth product SBP to calculate the information distribution both in the recording and reconstruction process The first resolution improvement method is based on the synthetic aperture method In this manner an increased sensor area can be obtained resulting in a larger numerical aperture NA A larger NA enables a more detailed reconstruction The problem encountered in doing this is that an increased optical resolution results in a smaller depth of field This has been overcome in this thesis by applying the extended depth of field method As a result a high resolution in focus reconstruction of all longitudinal object regions is obtained Moreover the extended depth of field method allows a topological mapping of the object The second resolution improvement method is based on sampling the interference pattern with sub pixel accuracy This was carried out on a CMOS sensor and implemented by moving the light sensitive pixel area into the dead zone in a 4x4 grid to cover whole the pixel area As a result the sensor's sampling frequency is doubled The increased sampling frequency permits a reduction of the recording distance which results in an increased optical resolution of the reconstructed hologram The third and novel approach described in this thesis has been to increase the optical resolution stored in a digital hologram by the combination of the synthetic aperture and the sub pixel sampling method By analogy with the Fresnel The resolution improvement methods have been demonstrated both for lensless digital holography and digital holographic microscopy
