Analyzing Within-subjects Experiments John W. Cotton, 2013-05-13 Most behavioral scientists know two important concepts how to analyze continuous data from randomly assigned treatment groups of subjects and how to assess practice effects for a single group of subjects given a constant treatment at each of several stages of practice However except in the case of the repeated measures Latin square design researchers are not facile in analyzing data from different subjects receiving different treatments at various times in an experiment This book helps fill the void

Kutsch, Michael Bahn, Andreas Heinemeyer, 2010-01-07 Carbon stored in soils represents the largest terrestrial carbon pool and factors affecting this will be vital in the understanding of future atmospheric CO₂ concentrations This book provides an integrated view on measuring and modeling soil carbon dynamics Based on a broad range of in depth contributions by leading scientists it gives an overview of current research concepts developments and outlooks and introduces cutting edge methodologies ranging from questions of appropriate measurement design to the potential application of stable isotopes and molecular tools It includes a standardised soil CO₂ efflux protocol aimed at data consistency and inter site comparability and thus underpins a regional and global understanding of soil carbon dynamics This book provides an important reference work for students and scientists interested in many aspects of soil ecology and biogeochemical cycles policy makers carbon traders and others concerned with the global carbon cycle

Model Building in Economics Lawrence A. Boland, 2014 Concern about the role and the limits of modeling has heightened after repeated questions were raised regarding the dependability and suitability of the models that were used in the run up to the 2008 financial crash In this book Lawrence Boland provides an overview of the practices of and the problems faced by model builders to explain the nature of models the modeling process and the possibility for and nature of their testing In a reflective manner the author raises serious questions about the assumptions and judgments that model builders make in constructing models In making his case he examines the traditional microeconomics macroeconomics separation with regard to how theoretical models are built and used and how they interact paying particular attention to the use of equilibrium concepts in macroeconomic models and game theory and to the challenges involved in building empirical models testing models and using models to test theoretical explanations

Burnham,David R. Anderson,2013-11-11

We wrote this book to introduce graduate students and research workers in various scientific disciplines to the use of information theoretic approaches in the analysis of empirical data In its fully developed form the information theoretic approach allows inference based on more than one model including estimates of unconditional precision in its initial form it is

useful in selecting a best model and ranking the remaining models We believe that often the critical issue in data analysis is the selection of a good approximating model that best represents the inference supported by the data an estimated best approximating model In formation theory includes the well known Kullback Leibler distance between two models actually probability distributions and this represents a fundamental quantity in science In 1973 Hirotugu Akaike derived an estimator of the relative Kullback Leibler distance based on Fisher s maximized log likelihood His mea sure now called Akaike s information criterion AIC provided a new paradigm for model selection in the analysis of empirical data His approach with a funda mental link to information theory is relatively simple and easy to use in practice but little taught in statistics classes and far less understood in the applied sciences than should be the case We do not accept the notion that there is a simple true model in the biological sciences

Advances in Intelligent Data Analysis XX Tassadit Bouadi,Elisa Fromont,Eyke Hüllermeier,2022-04-06 This book constitutes the proceedings of the 20th International Symposium on Intelligent Data Analysis IDA 2022 which was held in Rennes France during April 20 22 2022 The 31 papers included in this book were carefully reviewed and selected from 73 submissions They deal with high quality novel research in intelligent data analysis

Agent-based Models and Causal Inference Gianluca Manzo,2022-01-28 Agent based Models and Causal Inference Scholars of causal inference have given little credence to the possibility that ABMs could be an important tool in warranting causal claims Manzo s book makes a convincing case that this is a mistake The book starts by describing the impressive progress that ABMs have made as a credible methodology in the last several decades It then goes on to compare the inferential threats to ABMs versus the traditional methods of RCTs regression and instrumental variables showing that they have a common vulnerability of being based on untestable assumptions The book concludes by looking at four examples where an analysis based on ABMs complements and augments the evidence for specific causal claims provided by other methods Manzo has done a most convincing job of showing that ABMs can be an important resource in any researcher s tool kit Christopher Winship Diker Tishman Professor of Sociology Harvard University USA Agent based Models and Causal Inference is a first rate contribution to the debate on and practice of causal claims With exemplary rigor systematic precision and pedagogic clarity this book contrasts the assumptions about causality that undergird agent based models experimental methods and statistically based observational methods discusses the challenges these methods face as far as inferences go and in light of this discussion elaborates the case for combining these methods respective strengths a remarkable achievement Ivan Ermakoff Professor of Sociology University of Wisconsin Madison USA Agent based models are a uniquely powerful tool for understanding how patterns in society may arise in often surprising and counter intuitive ways This book offers a strong and deeply reflected argument for how ABM s can do much more add to actual empirical explanation The work is of great value to all social scientists interested in learning how computational modelling can help unraveling the complexity of the real social world Andreas Flache Professor of Sociology at the University of Groningen Netherlands Agent

based Models and Causal Inference is an important and much needed contribution to sociology and computational social science The book provides a rigorous new contribution to current understandings of the foundation of causal inference and justification in the social sciences It provides a powerful and cogent alternative to standard statistical causal modeling approaches to causation Especially valuable is Manzo s careful analysis of the conditions under which an agent based simulation is relevant to causal inference The book represents an exceptional contribution to sociology the philosophy of social science and the epistemology of simulations and models Daniel Little Professor of philosophy University of Michigan USA Agent based Models and Causal Inference delivers an insightful investigation into the conditions under which different quantitative methods can legitimately hold to be able to establish causal claims The book compares agent based computational methods with randomized experiments instrumental variables and various types of causal graphs Organized in two parts Agent based Models and Causal Inference connects the literature from various fields including causality social mechanisms statistical and experimental methods for causal inference and agent based computation models to help show that causality means different things within different methods for causal analysis and that persuasive causal claims can only be built at the intersection of these various methods Readers will also benefit from the inclusion of A thorough comparison between agent based computation models to randomized experiments instrumental variables and several types of causal graphs A compelling argument that observational and experimental methods are not qualitatively superior to simulation based methods in their ability to establish causal claims Practical discussions of how statistical experimental and computational methods can be combined to produce reliable causal inferences Perfect for academic social scientists and scholars in the fields of computational social science philosophy statistics experimental design and ecology Agent based Models and Causal Inference will also earn a place in the libraries of PhD students seeking a one stop reference on the issue of causal inference in agent based computational models

Experimental Design and Data Analysis for Biologists Gerald Peter Quinn, Michael J. Keough, 2002-03-21 An essential textbook for any student or researcher in biology needing to design experiments sample programs or analyse the resulting data The text begins with a revision of estimation and hypothesis testing methods covering both classical and Bayesian philosophies before advancing to the analysis of linear and generalized linear models Topics covered include linear and logistic regression simple and complex ANOVA models for factorial nested block split plot and repeated measures and covariance designs and log linear models Multivariate techniques including classification and ordination are then introduced Special emphasis is placed on checking assumptions exploratory data analysis and presentation of results The main analyses are illustrated with many examples from published papers and there is an extensive reference list to both the statistical and biological literature The book is supported by a website that provides all data sets questions for each chapter and links to software

Climate Change Modeling Methodology Philip J. Rasch, 2012-12-09 The Earth s average temperature has risen by 1.4 F over the past century and computer models project

that it will rise much more over the next hundred years with significant impacts on weather climate and human society Many climate scientists attribute these increases to the build up of greenhouse gases produced by the burning of fossil fuels and to the anthropogenic production of short lived climate pollutants Climate Change Modeling Methodologies Selected Entries from the Encyclopaedia of Sustainability Science and Technology provides readers with an introduction to the tools and analysis techniques used by climate change scientists to interpret the role of these forcing agents on climate Readers will also gain a deeper understanding of the strengths and weaknesses of these models and how to test and assess them The contributions include a glossary of key terms and a concise definition of the subject for each topic as well as recommendations for sources of more detailed information

Model Based Inference in the Life Sciences David R. Anderson, 2007-12-22 This textbook introduces a science philosophy called information theoretic based on Kullback Leibler information theory It focuses on a science philosophy based on multiple working hypotheses and statistical models to represent them The text is written for people new to the information theoretic approaches to statistical inference whether graduate students post docs or professionals Readers are however expected to have a background in general statistical

principles regression analysis and some exposure to likelihood methods This is not an elementary text as it assumes reasonable competence in modeling and parameter estimation
