Modeling For Preparative Chromatography:

Modeling for Preparative Chromatography Georges Guiochon, Bingchang Lin, 2003-05-19 Nonlinear chromatography is a field that borders both chemical engineering and physical chemistry In turn the theory of nonlinear chromatography is the foundation of preparative chromatography a separation process that has lately become of considerable interest in the pharmaceutical industry Only chromatography is sufficiently flexible and powerful to satisfy the practical requirements encountered in most difficult separations of pharmaceuticals and pharmaceutical intermediates Since nonlinear behaviour is strictly a mathematical concept it is difficult to leave mathematics out of any fundamental study of nonlinear chromatography Therefore Modeling for Preparative Chromatography will describe the different mathematical models of chromatography examine the assumptions on which they are based consider their properties and discuss their solutions All this will be done from a mathematical analysis point of view paying considerable attention to the influence of nonlinear behavior on the results Clear and simple discussions of the basic physico chemical phenomena involved in HPLC Clear and complete presentation of the relevant properties of the mathematical tools involved Detailed analysis of nonlinear effects **Liquid**

Techniques in Preparative Chromatography Dorota Antos, 2009-09 Chromatographic separations are usually realized in isocratic mode i e with constant temperature pressure or solvent composition of the mobile phase during the process However it is well known that the adsorption behavior of the system can be strongly affected by changes of these operating parameters in gradient mode In the work presented here several aspects of applying the gradient technique for preparative scale of both batch and continuous chromatography are discussed This analysis is included in the main PART II of the work It starts from the examination of a batch system consisting of a single column Subsequently strategies of using gradient in a continuous separation with a parallel multi column arrangement and with the SMB system are discussed Before analyzing the gradient technique the application of mathematical models of process dynamics for predicting chromatographic

separations is thoroughly examined in PART I of the work Moreover in PART I several aspects of the application of numerical methods for solving the model equations are discussed
