Modeling Nature Sharon E. Kingsland, 1988 *Modelling Nature* Sharon E. Kingsland, 1988 **Masterminding Nature** Margaret Derry, 2015-03-27 In *Masterminding Nature* Margaret Derry examines the evolution of modern animal breeding from the invention of improved breeding methodologies in eighteenth century England to the application of molecular genetics in the 1980s and 1990s A clear and concise introduction to the science and practice of artificial selection Derry's book puts the history of breeding in its scientific commercial and social context *Masterminding Nature* explains why animal breeders continued to use eighteenth century techniques well into the twentieth century why the chicken industry was the first to use genetics in its breeding programs and why it was the dairy cattle industry that embraced quantitative genetics and artificial insemination in the 1970s as well as answering many other questions Following the story right up to the present the book concludes with an insightful analysis of today's complex relationships between biology industry and ethics *Environmental and Hydrological Systems Modelling* A W Jayawardena, 2014-01-21 Mathematical modelling has become an indispensable tool for engineers scientists planners decision makers and many other professionals to make predictions of future scenarios as well as real impending events As the modelling approach and the model to be used are problem specific no single model or approach can be used to solve all problems and there are constraints in each situation Modellers therefore need to have a choice when confronted with constraints such as lack of sufficient data resources expertise and time *Environmental and Hydrological Systems Modelling* provides the tools needed by presenting different approaches to modelling the water environment over a range of spatial and temporal scales Their applications are shown with a series of case studies taken mainly from the Asia Pacific Region Coverage includes Population dynamics Reaction kinetics Water quality systems Longitudinal dispersion Time series analysis and forecasting Artificial neural networks Fractals and chaos Dynamical systems Support vector machines Fuzzy logic systems Genetic algorithms and genetic programming This book will be of great value to advanced students professionals academics and researchers working in the water environment *The Norton History of the Environmental Sciences* Peter J. Bowler, 1993 In *The Norton History of the Environmental Sciences* Peter J Bowler chronicles humanity's long quest to understand its own origins brilliantly synthesizing the discoveries in geography geology and evolutionary biology that have brought us to our current knowledge of the fragility and connectedness of life on Earth and created the new science of ecology *The Ecology of the Ancient Greek World* Robert Sallares, 1991 A pioneering study in historical population biology this book offers the first comprehensive ecological history of the ancient Greek world It proposes a new model for treating the relationship between the population and the land centering on the distribution and abundance of living organisms **The Balance of Nature and Human Impact** Klaus Rohde, 2013-02-14 It is clear that nature is undergoing rapid changes as a result of human activities such as industry agriculture travel fisheries and urbanisation What effects do these activities have Are they disturbing equilibria in

ecological populations and communities thus upsetting the balance of nature or are they enhancing naturally occurring disequilibria perhaps with even worse consequences It is often argued that large scale fluctuations in climate and sea levels have occurred over and over again in the geological past long before human activities could possibly have had any impact and that human effects are very small compared to those that occur naturally Should we conclude that human activity cannot significantly affect the environment or are these naturally occurring fluctuations actually being dangerously enhanced by humans This book examines these questions first by providing evidence for equilibrium and non equilibrium conditions in relatively undisturbed ecosystems and second by examining human induced effects The Structural Links between

Ecology, Evolution and Ethics Donato Bergandi, 2013-01-06 Evolutionary biology ecology and ethics at first glance three different objects of research three different worldviews and three different scientific communities In reality there are both structural and historical links between these disciplines First some topics are obviously common across the board Second the emerging need for environmental policy management has gradually but radically changed the relationship between these disciplines Over the last decades in particular there has emerged a need for an interconnecting meta paradigm that integrates more strictly evolutionary studies biodiversity studies and the ethical frameworks that are most appropriate for allowing a lasting co evolution between natural and social systems Today such a need is more than a mere luxury it is an epistemological and practical necessity **Introduction to Population Ecology** Larry L. Rockwood, 2009-03-12

Introduction to Population Ecology is an accessible and up to date textbook covering all aspects of population ecology Discusses field and laboratory data to illustrate the fundamental laws of population ecology Provides an overview of how population theory has developed Explores single species population growth and self limitation metapopulations and a broad range of interspecific interactions including parasite host predator prey and plant herbivore Keeps the mathematics as simple as possible using a careful step by step approach and including graphs and other visual aids to help understanding Artwork from the book is available to instructors online at www.blackwellpublishing.com/rockwood and by request on CD ROM **Mathematical Models in Population Biology and Epidemiology** Fred Brauer, Carlos

Castillo-Chavez, 2013-03-09 As the world population exceeds the six billion mark questions of population explosion of how many people the earth can support and under which conditions become pressing Some of the questions and challenges raised can be addressed through the use of mathematical models but not all The goal of this book is to search for a balance between simple and analyzable models and unsolvable models which are capable of addressing important questions such as these Part I focusses on single species simple models including those which have been used to predict the growth of human and animal population in the past Single population models are in some sense the building blocks of more realistic models the subject of Part II Their role is fundamental to the study of ecological and demographic processes including the role of population structure and spatial heterogeneity the subject of Part III This book which includes both examples and exercises

will be useful to practitioners graduate students and scientists working in the field

Population Dynamics and the Tribolium Model: Genetics and Demography Robert F. Costantino, Robert A. Desharnais, 2012-12-06 The study of populations is becoming increasingly focused on dynamics We believe there are two reasons for this trend The first is the impact of nonlinear dynamics with its exciting ideas and colorful language bifurcations domains of attraction chaos fractals strange attractors Complexity which is so very much a part of biology now seems to be also a part of mathematics A second trend is the accessibility of the new concepts The barriers to communication between the theorist and experimentalist seem less impenetrable The active participation of the experimentalist means that the theory will obtain substance Our role is the application of the theory of dynamics to the analysis of biological populations We began our work early in 1979 by writing an ordinary differential equation for the rate of change in adult numbers which was based on an equilibrium model proposed a decade earlier During the next few months we filled our notebooks with straightforward deductions from the model and its associated biological implications Slowly some of the biological observations were explained and papers followed on a variety of topics genetic and demographic stability stationary probability distributions for population size population growth as a birth death process natural selection and density dependent population growth genetic disequilibrium and the stationary stochastic dynamics of adult numbers

From Models to Simulations Franck Varenne, 2018-09-03 This book analyses the impact computerization has had on contemporary science and explains the origins technical nature and epistemological consequences of the current decisive interplay between technology and science an intertwining of formalism computation data acquisition data and visualization and how these factors have led to the spread of simulation models since the 1950s Using historical comparative and interpretative case studies from a range of disciplines with a particular emphasis on the case of plant studies the author shows how and why computers data treatment devices and programming languages have occasioned a gradual but irresistible and massive shift from mathematical models to computer simulations The Open Access version of this book available at <http://www.taylorfrancis.com> has been made available under a Creative Commons Attribution Non Commercial No Derivatives CC BY NC ND 4.0 license

The Experimental Side of Modeling Isabelle F. Peschard, Bas C. van Fraassen, 2018-10-02 An innovative multifaceted approach to scientific experiments as designed by and shaped through interaction with the modeling process The role of scientific modeling in mediation between theories and phenomena is a critical topic within the philosophy of science touching on issues from climate modeling to synthetic models in biology high energy particle physics and cognitive sciences Offering a radically new conception of the role of data in the scientific modeling process as well as a new awareness of the problematic aspects of data this cutting edge volume offers a multifaceted view on experiments as designed and shaped in interaction with the modeling process Contributors address such issues as the construction of models in conjunction with scientific experimentation the status of measurement and the function of experiment in the identification of relevant parameters how the phenomena under study are reconceived when

accounted for by a model and the interplay between experimenting modeling and simulation when results do not mesh Highlighting the mediating role of models and the model dependence as well as theory dependence of data measurement this volume proposes a normative and conceptual innovation in scientific modeling that the phenomena to be investigated and modeled must not be precisely identified at the start but specified during the course of the interactions arising between experimental and modeling activities Contributors Nancy D Cartwright U of California San Diego Anthony Chemero U of Cincinnati Ronald N Giere U of Minnesota Jenann Ismael U of Arizona Tarja Knuuttila U of South Carolina Andrea Loettgers U of Bern Switzerland Deborah Mayo Virginia Tech Joseph Rouse Wesleyan U Paul Teller U of California Davis Michael Weisberg U of Pennsylvania Eric Winsberg U of South Florida

Rereading the Fossil Record David Sepkoski, 2022-12-22 David Sepkoski's book is the first to examine the rise of paleobiology and the emergence of macroevolution as a discipline in the 1970s Kevin Padian University of California Berkeley Rereading the Fossil Record presents the first ever historical account of the origin rise and importance of paleobiology from the mid nineteenth century to the late 1980s Drawing on a wealth of archival material David Sepkoski shows how the movement was conceived and promoted by a small but influential group of paleontologists and examines the intellectual disciplinary and political dynamics involved in the ascendancy of paleobiology By tracing the role of computer technology large databases and quantitative analytical methods in the emergence of paleobiology this book also offers insight into the growing prominence and centrality of data driven approaches in recent science In the 1970s a new kid on the block was shaking up paleontology geology and biology Historian David Sepkoski charts the rise of paleobiology from 1945 to 1985 driven by a small but illustrious band of paleontologists including Stephen Jay Gould and David Raup who grappled with how the geological record could produce evidence for evolution The solution as Sepkoski engagingly relates lay in quantitative analysis of evolutionary patterns in fossils Nature David Sepkoski's book is the one book that anyone interested in evolution should buy this year And next year And probably the year after The reason is that for the first time the emergence of the modern science of macroevolution receives its due Reports of the National Center for Science Education

Fundamental Processes in Ecology David M Wilkinson, 2007-09-13 Fundamental Processes in Ecology presents a way to study ecosystems that is not yet available in ecology textbooks but is resonant with current thinking in the emerging fields of geobiology and Earth System Science It provides an alternative process based classification of ecology and proposes a truly planetary view of ecological science To achieve this it asks and endeavours to answer the question what are the fundamental ecological processes which would be found on any planet with Earth like carbon based life The author demonstrates how the idea of fundamental ecological processes can be developed at the systems level specifically their involvement in control and feedback mechanisms This approach allows us to reconsider basic ecological ideas such as energy flow guilds trade offs carbon cycling and photosynthesis and to put these in a global context In doing so the book puts a much stronger emphasis on microorganisms than has traditionally been the case The integration of Earth System Science with ecology is vitally important if ecological science is to successfully contribute to the massive problems and future challenges associated with global change Although the approach is heavily influenced by Lovelock's Gaia hypothesis this is not a popular science book about Gaian theory Instead it is written as an accessible text for graduate student seminar courses and researchers in the fields of ecology earth system science evolutionary biology palaeontology history of life astrobiology geology and physical geography

Computational Techniques for Modelling Learning in Economics Thomas Brenner, 2012-12-06 Computational Techniques for Modelling Learning in Economics offers a critical overview of the computational techniques that are frequently used for modelling learning in economics It is a collection of papers each of which focuses on a different way of modelling learning including the techniques of evolutionary algorithms genetic programming neural networks classifier systems local interaction models least squares learning Bayesian learning boundedly rational models and cognitive learning models Each paper describes the technique it uses gives an example of its applications and discusses the advantages and disadvantages of the technique Hence the book offers some guidance in the field of modelling learning in computation economics In addition the material contains state of the art applications of the learning models in economic contexts such as the learning of preference the study of bidding behaviour the development of expectations the analysis of economic growth the learning in the repeated prisoner's dilemma and the changes of cognitive models during economic transition The work even includes innovative ways of modelling learning that are not common in the literature for example the study of the decomposition of task or the modelling of cognitive learning
