

Although it would be possible to mount the usual ionisation chamber on a similar vertical circle the mechanical difficulties would be very considerable. These are avoided in the present instrument by reason of its small size. It would not be possible to make it so small but for the electrometer invented by Professor Schonland. This consists of a simple leaf-electroscope in which a thin platinised rectangular piece of mica, A, replaces the usual gold-leaf. The mica, because of its rigidity, is capable of acting as a mirror even when thin enough for the moving part of the electroscope, and a large magnification of the movement of the leaf is obtained by receiving the reflected beam on a vertical scale about 50 cms. away. The X-rays after passing through the thin cylindrical aluminium window BB produce ionisation in the space indicated by the shading, the apparatus being filled with argon. The whole electrometer and ionisation chamber is mounted on gimbals so that it takes up a parallel position at every point round the vertical circle. In this way the zero of the mica mirror can always be made to come to the same point on the scale. In addition to increasing the ease of observing the X-ray intensities, this system is rather more sensitive to X-rays than the usual ionisation spectrometer.

SOME MODERN DEVELOPMENTS OF WAVE MECHANICS AND THEIR BEARING ON THE UNDERSTANDING OF CRYSTAL STRUCTURE.

By P. P. EWALD (*Stuttgart*).*

(*Delivered before the Society on 15th March, 1929.*)

1. The Schroedinger Picture of the Atom.

Wave mechanics gives a far simpler picture of an atom than the former complicated orbits of the planetary system of electrons. The greatest difference between the new and the old theory of the atom is that any given electron cannot any longer be given a particular location in the atom. Only statistical statements as to the location of the electric charges are possible. We may speak of an electric density ρ in the interior of the atom, in the sense, perhaps, of a time average of the positions of the electron. At all events we may use this density for calculating the effect of the atom on its environment as if the space charge ρ were a real density of electric charge. ρ is given by the square of the quantity ψ the fundamental mathematical quantity in Schroedinger's theory, which is determined by a differential equation closely related to Hamilton's differential equation in ordinary mechanics. This equation is

$$\Delta\psi + \frac{8\pi^2m}{h^2}(E - V)\psi = 0 \quad . \quad . \quad . \quad (1)$$

Here m is the mass of the electron, V the potential acting on it, which may originate in the central charge of the atom, h is Planck's constant, and E the total energy of the atom. This equation is the same as that occurring in classical dynamics for vibrations of a given frequency propagated in an

Quantum Mechanics: A Modern Development (2nd Edition) Leslie E Ballentine, 2014-08-28 Although there are many textbooks that deal with the formal apparatus of quantum mechanics QM and its application to standard problems none take into account the developments in the foundations of the subject which have taken place in the last few decades There are specialized treatises on various aspects of the foundations of QM but none that integrate those topics with the standard material This book aims to remove that unfortunate dichotomy which has divorced the practical aspects of the subject from the interpretation and broader implications of the theory In this edition a new chapter on quantum information is added As the topic is still in a state of rapid development a comprehensive treatment is not feasible The emphasis is on the fundamental principles and some key applications including quantum cryptography teleportation of states and quantum computing The impact of quantum information theory on the foundations of quantum mechanics is discussed In addition there are minor revisions to several chapters The book is intended primarily as a graduate level textbook but it will also be of interest to physicists and philosophers who study the foundations of QM Parts of it can be used by senior undergraduates too

Recent Developments in Micromechanics D.R. Axelrad, Wolfgang Muschik, 2012-12-06 This volume contains the lectures presented at the mini symposium on Micromechanics held in conjunction with the CSME Mechanical Engineering

Forum 1990 between the 3rd and 8th June 1990 at the University of Toronto Canada The expressed purpose of this symposium was to discuss some recent developments in the Micromechanics of Materials and how advances in this field now relate to the solution of practical engineering problems Due to the time limit set for this section of the Engineering Forum as well as the restriction on the number of papers to be presented it was not possible to cover a much wider range of topics However an attempt was made to include the most important advances associated with the progress made in micromechanics in its application to material science and engineering over the past decade Thus the topics are concerned with the fundamental aspects of the thermodynamics of structured solids part I the micromechanical behaviour of alloys part II the modelling of the material behaviour on the basis of continuum theory part III and finally the important new approach to the characterization of various materials and their responses to external agencies by the use of probabilistic micromechanics part IV We would like to take this opportunity to thank the Chairman of the Organizing Committee Prof F P J Rimrott and the President of the CSME Prof T S

The European Drag Reduction Meeting has been held on 15th and 16th November 1990 in London This was the fifth of the annual European meetings on drag reduction in engineering flows The main objective of this meeting was to discuss up to date results of drag reduction research carried out in Europe The organiser has adopted the philosophy of discussing the yesterday's results rather than the last year's results No written material has therefore been requested for the meeting It was only after the meeting the submission of papers was requested to the participants from which 16 papers were selected for this proceedings volume The meeting has attracted a record number of participants with a total of 52 researchers from seven European countries U K France Germany the Netherlands Italy Switzerland and U S S R as well as from Japan Canada and Australia The subjects covered in this proceedings volume include riblets LEBUs Large Eddy Break Up device surface roughness compliant surfaces and polymer additives Riblets seem to be one of the most extensively studied devices in the past years Reflecting this situation in the European community there are six papers on riblets covering their practical applications to aircraft and to a model ship near wall coherent structure of the boundary layer and effects of flow three dimensionality Possibility of heat transfer enhancement with riblets and potential use in the laminar flow are also investigated An analytical model is developed for the boundary layer with a LEBU device

Recent Development of Aerodynamic Design Methodologies Kozo Fujii, George Dulikravich, 2013-04-17

Computational Fluid Dynamics CFD has made remarkable progress in the last two decades and is becoming an important if not inevitable analytical tool for both fundamental and practical fluid dynamics research The analysis of flow fields is important in the sense that it improves the researcher s understanding of the flow features CFD analysis also indirectly helps the design of new aircraft and or spacecraft However design methodologies are the real need for the development of aircraft or spacecraft They directly contribute to the design process and can significantly shorten the design cycle Although quite a

few publications have been written on this subject most of the methods proposed were not used in practice in the past due to an immature research level and restrictions due to the inadequate computing capabilities With the progress of high speed computers the time has come for such methods to be used practically There is strong evidence of a growing interest in the development and use of aerodynamic inverse design and optimization techniques This is true not only for aerospace industries but also for any industries requiring fluid dynamic design This clearly shows the matured engineering need for optimum aerodynamic shape design methodologies Therefore it seems timely to publish a book in which eminent researchers in this area can elaborate on their research efforts and discuss it in conjunction with other efforts Recent Developments
