Soil Management Jerry L. Hatfield, Thomas J. Sauer, 2020-01-22. Degradation of soils continues at a pace that will eventually create a local, regional or even global crisis when diminished soil resources collide with increasing climate variation. It is not too late to restore our soils to a more productive state by rediscovering the value of soil management, building on our well established and ever expanding scientific understanding of soils. Soil management concepts have been in place since the cultivation of crops, but we need to rediscover the principles that are linked together in effective soil management. This book is unique because of its treatment of soil management based on principles, the physical, chemical and biological processes and how together they form the foundation for soil management processes that range from tillage to nutrient management. Whether new to soil science or needing a concise reference, readers will benefit from this book's ability to integrate the science of soils with management issues and long term conservation efforts.

Deficit Irrigation Practices Food and Agriculture Organization of the United Nations, 2002-01-01. The great challenge for the future will be the task of increasing food production with less water, particularly in countries with limited water and land resources. In the context of improving water productivity, there is a growing interest in deficit irrigation, an irrigation practice whereby water supply is reduced below maximum levels and mild stress is allowed with minimal effects on yield. This publication presents a range of studies carried out for several crops and under different ecological conditions, showing the various options and practices of deficit irrigation and the impacts of reduced irrigation water supply on crop yield. The synthesis

shows that deficit irrigation can result in substantial water savings with little impact on the quality and quantity of the harvested yield
