Knowledge Intensive Computer Aided Design Susan Finger, Tetsuo Tomiyama, Martti Mäntylä, 2013-03-09 Computer Aided Design CAD technology plays a key role in today's advanced manufacturing environment To reduce the time to market achieve zero defect quality the at first production and use available production and logistics resources effectively product and design process knowledge covering the whole product life cycle must be used throughout product design Once generated this intensive design knowledge should be made available to later life cycle activities Due to the increasing concern about global environmental issues and rapidly changing economical situation worldwide design must exhibit high performance not only in quality and productivity but also in life cycle issues including extended producer's liability This requires designers and engineers to use various kinds of design knowledge intensively during product design and to generate design information for use in later stages of the product life cycle such as production distribution operation maintenance reclamation and recycling Therefore future CAD systems must incorporate product and design process knowledge which is not explicitly dealt with in the current systems in their design tools and design object models

Process Planning Optimization in Reconfigurable Manufacturing Systems Farayi Musharavati, 2010-09 Trends and perspectives in dynamic environments point towards a need for optimal operating levels in reconfigurable manufacturing activities Central to the goal of meeting this need is the issue of appropriate techniques for manufacturing process planning optimization in reconfigurable manufacturing i e i what decision making models and ii what computational techniques provide an optimal manufacturing process planning solution in a multidimensional decision variables space Conventional optimization techniques are not robust hence they are not suitable for handling multidimensional search spaces On the other hand process planning optimization for reconfigurable manufacturing is not amenable to classical modeling approaches due to the presence of complex system dynamics Therefore this study explores how to model reconfigurable manufacturing activities in an optimization perspective and how to develop and select appropriate non conventional optimization techniques for reconfigurable process planning In this study a new approach to modeling Manufacturing Process Planning Optimization MPPO was developed by extending the concept of manufacturing optimization through a decoupled optimization method The uniqueness of this approach lies in embedding an integrated scheduling function into a partially integrated process planning function in order to exploit the strategic potentials of flexibility and reconfigurability in manufacturing systems Alternative MPPO models were constructed and variances associated with their utilization analyzed Five 5 Alternative Algorithm Design Techniques AADTs were developed and investigated for suitability in providing process planning solutions suitable for reconfigurable manufacturing The five 5 AADTs include a variant of the simulated annealing algorithm that implements heuristic knowledge at critical decision points
