Processes Of Recovery From Neural Trauma:

Processes of Recovery from Neural Trauma Gad M. Gilad, Alfredo Gorio, Georg W. Kreutzberg, 1986 Processes of Recovery from Neural Trauma Gad M. Gilad, Alfredo Gorio, G.W. Kreutzberg, 1986-03-01 The book on Processes of Recovery from Neural Trauma contains the proceedings of an international symposium which was sponsored by the Weizmann Institute of Science and was held in June 1984 in Israel One of the central problems in neurobiology and clinical neurology are the processes which underlie the ability of the nervous system to recover from damage Neurons of the mammalian nervous system cannot be replaced once the generative embryonic period has ended Thus recovery after trauma is limited by the degree to which regeneration of damaged neural processes is possible and by the capacity of uninjured neurons to form new synaptic contacts or to use their existing ones more effectively The lack of successful axon regeneration in the central nervous system is the reason for the permanent damage and the very limited recovery of function seen in victims of traumatic injury Over the past few years research on neural trauma has witnessed significant progress resulting from interdisciplinary research carried out in an increasing number of laboratories throughout the world Accordingly the book includes reports on the progress made in the forefront of research in this field We hope that in addition to being a source of new information readers of the book will be stimulated to work and to generate new ideas and research strategies in this field of research

Neuropsychological Aspects of Closed Head Injury Dr J Richardson, 2013-11-12 In all industrialised countries closed head injuries are responsible for vast numbers of hospital admissions and days of work lost For instance about 120 000 patients are admitted to hospital in the United Kingdom each year with a diagnosis that reflects closed head injury Such injuries are a major cause of deaths following accidents especially those that involve children and young people and they are also a major cause of handicap and morbidity among the survivors This clinical condition is intrinsically a neurological one but its proper evaluation demands an understanding of the associated psychology and psychopathology At the same time a major neurological condition with such a high level of incidence ought to be extremely informative about the functioning of the human brain and hence provide a major focus for neuropsychological investigation In this book the author seeks to integrate these two different perspectives by reviewing the clinical and neuropsychological aspects of closed head injury in a manner that is equally intelligible to researchers interested in the effects of brain damage upon human behaviour and to practitioners who are responsible for the assessment management and rehabilitation of head injured patients This is the second edition of a book which was first published in 1990 and which has been extensively revised in the light of the subsequent research in the field The book begins by considering the epidemiology causes and structural neuropathology of closed head injury It then considers the impact of closed head injury on memory cognition language communication personality and social behaviour Finally it outlines the outcome the mechanisms of recovery and the prospects for rehabilitation
