International Conflict Resolution Using System Engineering (SWIIS) H. Chestnut,T. Vamos,Peter Kopacek,2014-07-04

Finding an alternative to supplement military ways of resolving international conflicts has been taken up by many people skilled in various areas such as political science economics social studies modelling and simulation artificial intelligence and expert systems military strategy and weaponry as well as private business and industry The Workshop will therefore be of use as it looks at various control methods which would create a conciliatory social and political environment or climate for seeking and obtaining non military solutions to international conflicts and to solutions to national conflicts which may lead to international conflicts **The IDN-Based Universal System of Information and Discordance Process** Malek M.

Nazemi, MD, PhD, FACP,2025-05-30 The US while spending far more of its GDP on health care ranks among the worst performing members of all the western industrial nations According to CMS that figure was 4 4 trillion dollars in 2022 and is expected to exceed 6 8 trillion by 2030 Despite these figures 44 percent of all Americans struggle to pay for their health care The purpose of this book is to define most important sources for this excessive health care costs and inefficiency in the US and describe methods to rectify those serious shortcomings Human error is one of the leading causes for health care ineffectiveness and wastefulness and is brought about by factors such as fatigue time pressure workload omission repetition distraction and insufficient knowledge Among other contributing factors include shortage of staff mostly because of too much paperwork routines administrative burdens material management and so on The described universal system of information works closely with its users and substantially lightens all the above alluded to overheavy burdens This system uses an interdepartmental network IDN method for managing a total patient care in all arenas of care It constantly monitors the entire health care data and interacts with its users Any piece of information is quantified with a score and used as an option operating factor that must discord compete with other related options to best satisfy a specific objective core factor This process is called contextual quantification The system is constantly in touch with the users and if there is a need it continually recommends corrective steps However it is always the user who ultimately must make the final decision Being a physician in this book my focus has been on health sciences subgroup A human medicine With some modification however this IDN based universal system of information can be applicable to other disciplines as well **Discrete Time Series,**

Processes, and Applications in Finance Gilles Zumbach,2012-10-04 Most financial and investment decisions are based on considerations of possible future changes and require forecasts on the evolution of the financial world Time series and processes are the natural tools for describing the dynamic behavior of financial data leading to the required forecasts This book presents a survey of the empirical properties of financial time series their descriptions by means of mathematical processes and some implications for important financial applications used in many areas like risk evaluation option pricing or

portfolio construction The statistical tools used to extract information from raw data are introduced Extensive multiscale empirical statistics provide a solid benchmark of stylized facts heteroskedasticity long memory fat tails leverage in order to assess various mathematical structures that can capture the observed regularities The author introduces a broad range of processes and evaluates them systematically against the benchmark summarizing the successes and limitations of these models from an empirical point of view The outcome is that only multiscale ARCH processes with long memory discrete multiplicative structures and non normal innovations are able to capture correctly the empirical properties In particular only a discrete time series framework allows to capture all the stylized facts in a process whereas the stochastic calculus used in the continuum limit is too constraining The present volume offers various applications and extensions for this class of processes including high frequency volatility estimators market risk evaluation covariance estimation and multivariate extensions of the processes The book discusses many practical implications and is addressed to practitioners and quants in the financial industry as well as to academics including graduate Master or PhD level students The prerequisites are basic statistics and some elementary financial mathematics
