## Abstract

Interest in the foundations of the theory of choice under uncertainty was stimulated by applications of expected utility theory such as the Sandmo model of production under uncertainty. The development of generalized expected utility models raised the question of whether such models could be used in the analysis of applied problems such as those involving production under uncertainty. Finally, the revival of the state-contingent approach led to the recognition of a fundamental duality between choice problems and production problems.

The field of generalized expected utility theory had its beginnings with the classic paper of Allais (1953), proposing counterexamples to the expected utility (EU) theory of Von Neumann and Morgenstern (1944). Although this paper was well-known, and frequently cited, over the next 3 decades, it was not until the late 1970s that Allais' critique became the basis of a substantial research program. The state-contingent approach to production under uncertainty has had a rather similar history.

When economists were first embarking on the study of problems involving uncertainty, Arrow (1953) and Debreu (1952) developed the elegantly simple idea of state-contingent commodities. The project of developing a rigorous general equilibrium theory had already led to the notion of differentiating commodities by their time and place of delivery. It was a relatively small step to deal with uncertainty through the notion of state-contingent commodities; that is, commodities whose delivery is contingent on the occurrence of a particular state of nature. Once this connection was made, all the tools developed for a non-stochastic world could be applied almost effortlessly to decision-making under uncertainty. In

**Decision Making Under Uncertainty** Claude Greengard, Andrzej Ruszczynski, 2012-12-06 In the ideal world major decisions would be made based on complete and reliable information available to the decision maker We live in a world of uncertainties and decisions must be made from information which may be incomplete and may contain uncertainty The key mathematical question addressed in this volume is how to make decision in the presence of quantifiable uncertainty The volume contains articles on model problems of decision making process in the energy and power industry when the available information is noisy and or incomplete The major tools used in studying these problems are mathematical modeling and optimization techniques especially stochastic optimization These articles are meant to provide an insight into this rapidly developing field which lies in the intersection of applied statistics probability operations research and economic theory It is hoped that the present volume will provide entry to newcomers into the field and stimulation for further research

C. Mohr, Ming Hsu, 2015-06-16 Most decisions in life are based on incomplete information and have uncertain consequences To successfully cope with real life situations the nervous system has to estimate represent and eventually resolve uncertainty at various levels A common tradeoff in such decisions involves those

between the magnitude of the expected rewards and the uncertainty of obtaining the rewards For instance a decision maker may choose to forgo the high expected rewards of investing in the stock market and settle instead for the lower expected reward and much less uncertainty of a savings account Little is known about how different forms of uncertainty such as risk or ambiguity are processed and learned about and how they are integrated with expected rewards and individual preferences throughout the decision making process With this Research Topic we aim to provide a deeper and more detailed understanding of the processes behind decision making under uncertainty
