

Quick Guide to FORTRAN 90

Sources:

- a) Programmer's Guide to Fortran 90, Brainerd, Goldberg, Adams, Springer 1996, 445p
- b) Fortran 90: A Reference Guide, Chamberland; Prentice Hall 1995

General Remarks

- Short sample program illustrating some features:

```
program quote
  implicit none
  integer :: n,m
  n = 0; m = n + 1 ! multiple commands in same line
  print *, n, m    ! default format for print
  read *, v
  call listing
  if (m > n) m = n
  m = m + m**2 &    ! continuation of line
    m + n**2
```

contains

subroutine listing

...

end subroutine listing

end program quote ! Always write the name

- Use of lowercase is allowed. In fact it is good style.
- Free form source: No specified columns. Comments begin with !. To continue line use &. This is the default if your file has extension .f90
- Command implicit none means that compiler does not assume type from the name of the variable like before (i,j,k integer, x,y,z reals). Should put this in every program. It's enough to have this declaration just once in a file.
- Multiple statements in the same line, separated by ;
- The command stop ["message"] aborts the execution of the program and displays the "message". Should be used only in error routines.
- The command include "name" includes a file in the program.

Structure of the Code

Here is a form of the program. The order of commands that appear below is obligatory.

```
program/function/subroutine/module name_
[use name_]
```

implicit none

(parameter statements)

(type declaration/variables/interface blocks)

[contains]

(internal procedures)

end program/function/subroutine/module name_

Control Commands

- At the end command always repeat the name of the structure being finished. Ex: end program quote

if (a==b) then

....

else if (....) then

....

end if

if (a>b) a = b ! No then needed here

label:if (...) then

...

end if label ! if with label

[label:] select case (dice)

case (2:3,12)

print *, ""

case (7,11)

case default

end select [label]

- Do is the only looping construct in Fortran. Three forms:

a) No loop control. Do forever, leaves only with exit command. There are two ways of jumping inside loop:

- exit leaves the innermost loop. With a label it's possible to exit all loops nested in.

- cycle terminates one iteration. Return to beginning of loop. With label can return to the beginning of [label] loop.

[label:] do

if (...) cycle [label] ! go to do

if (...) exit [label] ! go to end do

end do [label]

- b) With a do variable. It's not recommended to use a real variable in the loop

```
do n=1,20          or   do n=1,20,2
end do             end do
n=1,2,3 ... 20      n=1,3,5 .. 19
```

- c) Do while loop

do while (ok)

...

end do

Procedures

There are two kinds of procedures: function and subroutine. They're classified as internal (contained in a program or in another procedure); module (contained in a module) and external (old standard, don't use it!). Internal procedures cannot be nested. Always repeat name of procedure at the end command.

- The statement return finishes the execution of a procedure. Useful, sometimes, in error conditions but should be avoided in general.

```
program bla
  implicit none
  real :: x,y

  call read_all
```
